Donald Trump repeatedly vowed to reduce regulation during the 2016 presidential campaign. Indeed, one of his key advisors promised to “deconstruct” the administrative state. Since taking office, President Trump has attempted to make good on his promises, spurring federal agencies to brush aside countless regulations that previous administrations had promulgated based on scientific, technological, or economic evidence. Those efforts, which some have dubbed a “war on science,” implicate a long-contested question in administrative law: to what extent should a change in presidential administrations excuse agencies from any obligation to justify changes in policy with expert, reasoned analysis of relevant data? Perhaps surprisingly, the Trump Administration’s efforts align with views that have dominated administrative law scholarship in recent decades. By the time President Trump took office, many leading administrative law scholars had already championed enhanced presidential control over agency decisions, dismissed expert analysis as an anachronistic relic of the New Deal, and suggested that the considered judgments of previous administrations should be amenable to quick and easy change.

This Article takes a contrary view and asserts a renewed role for expert, reasoned analysis in the face of politically motivated administrative change. Unlike earlier work, this Article identifies change as a fundamental and essential aspect of much expert decision making, and it explains that regulatory statutes often call for an exercise of expert judgment capable of incorporating frequently changing bodies of scientific, technological, or economic knowledge. This positive procedural account of agency decision making shows that the reasoned analysis contributed by agency expertise is far from superfluous, but helps give legitimacy and transparency to administrative government. By identifying the value of expertise within the context of politically directed policy changes, this Article addresses an under-theorized aspect of judicial review of agency decisions and reinforces the need for agencies to support changes in policy with reasoned, expert analysis.

INTRODUCTION

By spurring administrative agencies to roll back a spate of important regulations, the Trump Administration has followed through on its 2016 campaign promises. These rollbacks seek to undo regulations that were put in place to achieve a range of significant public benefits—from slowing the...
pace of global warming\(^1\) to eliminating water pollution\(^2\) and ensuring net neutrality.\(^3\) In carrying out its deregulatory program, one of the hallmarks of the Trump Administration’s approach has been to summarily reject relevant economic or scientific information, claiming that the harm calling for regulation does not exist.\(^4\) This strategy, which has been described as a “war on science,” manifests a “reflexively antiregulatory mind-set” and a belief that scientific evidence of phenomena such as global warming is, in the President’s own words, a “hoax.”\(^5\) To further this strategy, the President has appointed agency heads eager to implement his deregulatory philosophy, whatever the facts might be. These aggressive deregulatory efforts provide a salient example of government as the exercise of raw political will and implicate a long-contested issue in administrative law: to what extent may the exercise of political will justify immediate policy change and eliminate the need for agencies to engage in expert, reasoned analysis of relevant scientific, technological, or economic evidence before altering existing policy? This Article addresses the conflict between political will and informed expert analysis in the context of judicial review of administrative change. It argues that expert analysis has a positive, distinctive, and essential role to play.

Of course, President Trump’s desire to bend regulatory outcomes to political goals is hardly unique. Nor is that desire one that manifests itself only in Republican administrations.\(^6\) Perhaps surprisingly, an early proponent of “political supremacy”—a strong, centralized executive power to effectuate regulatory change—was none other than now-Justice Elena Kagan.\(^7\) In a 2001 article, then-Professor Kagan praised the degree of control

---

2 Also in response to an Executive Order, the EPA embarked on a series of rulemakings to undo water pollution limitations established by the Obama Administration’s 2015 Waters of the United States rule. See infra notes 78–99 and accompanying text.

6 See id. at 2246. Justice Kagan has not spoken about this subject in extra curial remarks since her appointment to the Court. Christopher Edley was another early proponent of this view. See CHRISTOPHER F. EDLEY, JR., ADMINISTRATIVE LAW: RETHINKING JUDICIAL CONTROL OF BUREAUCRACY 183 (1990).
that President Clinton exercised over administrative agencies: "[Clinton] developed a set of practices that enhanced his ability to influence or even dictate the content of administrative initiatives." While leading scholars have argued for enhanced presidential control over administrative decisions, scholars on both sides have dismissed expert analysis as an anachronistic relic of the New Deal. In addition, the Supreme Court has failed to form a stable majority on the essential question whether political will or expert analysis should take precedence, or on how the two values should be harmonized in the context of administrative change. Some Justices have emphasized the importance of "expert discretion" in administrative decision making, while others have focused on unfettered political control. While the latter group of Justices aligns with the dominant administrative law theory of recent decades (presidential control), those Justices who value expertise will find in the scholarly literature only an

11 See, e.g., Seidenfeld, supra note 10, at 148 (supporting “reasoned decision-making review” on the ground that it “is not a vestige of the expertise model”); Watts, supra note 9, at 13 (critiquing reasoned decision making review as resting on “an outmoded model of ‘expert’ decision-making”).
12 Compare Motor Vehicle Mfrs. Ass’n of the U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 54 (1983) (NHTSA failed to “bring its expertise to bear on the question” when rejecting safety benefits of automatic detachable seatbelts), with id. at 59 (Rehnquist, J., dissenting in part) (a “change in administration ... is a perfectly reasonable basis for an executive agency’s reappraisal” of these safety benefits).
13 In State Farm, Justice White’s majority opinion recognized that “[e]xpert discretion is the lifeblood of the administrative process.” Id. at 48 (internal quotation marks omitted). Similarly, Justice Kennedy’s concurrence in FCC v. Fox Television Stations, Inc. noted that agency decisions turning on “discoveries in science” must be “informed by the [agency’s] experience and expertise.” 556 U.S. 502, 535–36 (2009) (Kennedy, J., concurring).
14 State Farm, 463 U.S. at 58 (Rehnquist, J., dissenting in part).
15 Adrian Vermeule, Bureaucracy and Distrust: Landis, Jaffe, and Kagan on the Administrative State, 130 HARV. L. REV. 2463, 2478 (2017) (Presidential Administration is one of the most “prominent articles in administrative-law theory in recent decades”); see also Short, supra note 10, at 1815 (noting the “intellectual vogue for presidentialism”).
“impoverished understanding of expertise” and a failure to identify an important role for expertise in the face of administrative change.

This Article offers a different approach, namely, a positive procedural account that focuses on the indispensable value of agency expertise in the alteration of administrative policy. While previous scholarly work has conceptualized change in terms of the President’s political energy, this Article argues that change is also an essential attribute of much expert decision making. Expert decisions often turn, not on the mastery of static bodies of information, but on the assessment of evolving scientific, technological, or economic knowledge. Indeed, Congress has often acknowledged this fact by requiring agencies to make dynamic expert decisions in a broad array of regulatory statutes, including those that require environmental protection measures to reflect the “latest scientific knowledge” or the “best technology available.”

A positive procedural account of agency decision making also demonstrates that administrative agencies, amongst all government decisionmakers, are uniquely situated to incorporate evolving scientific, technological, or economic information into sound regulatory decisions; they are also well-positioned to balance the fits and spurts of advancing knowledge against traditional rule of law values such as stability and predictability. When a change in agency policy is considered, therefore, the exercise of expert judgment is not a meaningless procedural obstacle to achieving politically desired ends. Instead, agencies that exercise expert discretion and weigh relevant data add legitimacy and transparency to the dynamic expert determinations mandated by Congress.

---

19 Clean Water Act, 33 U.S.C. § 1326(b) (2012). Of course, such regulatory schemes do not represent the entire universe of significant regulatory decisions or address distinct moral concerns raised in areas such as immigration. See Regents of the Univ. of Cal. v. U.S. Dep’t of Homeland Sec., 908 F.3d 476, 510 (9th Cir. 2018) (rescission of DACA was “arbitrary and capricious” because it was based on “an erroneous view of what the law required”), cert. granted sub nom., Dep’t of Homeland Sec. v. Regents of the Univ. of Cal., 139 S. Ct. 2779 (2019). Still, agency decisions involving scientific, technological, and economic analysis remain a crucial part of the work of the modern administrative state.

20 For a discussion of why Congress, the President, and the courts cannot perform the same functions as agencies, see *infra* Part II.
The “reasoned analysis” that agencies must provide in support of changes in policy provides the public with an otherwise unavailable window into the actual basis for regulatory decisions and the tradeoffs that government necessarily makes. This type of reasoned, expert analysis stands apart from the exercise of raw political will, which may be entirely arbitrary and opaque. To be sure, political direction remains important, and it may sometimes be necessary, among other reasons, for overcoming the “slow pace” that has often plagued regulatory efforts. In addition, ultimate solutions to some regulatory problems may be “underdetermined by scientific data” and leave agencies free to consider political factors in reaching a final policy decision. Nevertheless, expert analysis remains “crucial” to an agency’s reasoned decision making obligations. A process that gives appropriate effect to both political and expert considerations cannot be equated with a purely political process, or to one that fails to inform the public as to where science ends and politics begins. The Trump Administration’s aggressive deregulatory stance incarncates the danger that political objectives may displace expert analysis and produce results that defy justification by reasoned analysis of relevant scientific or economic evidence.

The Trump Administration’s current deregulatory efforts echo those of the Reagan Administration in the 1980s. Because the Reagan Administration attempted to undo key regulations in a variety of areas, including environmental protection and automobile safety, the Supreme Court had occasion, in resolving challenges to those initiatives, to consider the proper

---

22 Administrative agencies must give reasoned explanations for their decisions and thus meet a higher standard than the “minimum rationality a statute must bear in order to withstand analysis under the Due Process Clause.” Id. at 43 n.9.
23 See Staszewski, supra note 10, at 860 (noting that pure “political preferences” may include campaign promises or executive preferences).
24 See Seidenfeld, supra note 10, at 197 (explaining that politics may motivate reasoned agency decisions).
27 Doremus, supra note 16, at 436.
28 See, e.g., Air All. Hous. v. EPA, 906 F.3d 1049, 1067 (D.C. Cir. 2018) (rejecting delay of Chemical Disaster Rules based on cursory conclusions that harm caused by chemical explosions was “speculative”); S.C. Coastal Conservation League v. Pruitt, 318 F. Supp. 3d 959, 967 (D.S.C. 2018) (order granting summary judgment) (holding that it was “arbitrary and capricious” for the EPA to issue a binding delay of the 2015 Waters of the United States rule without any consideration of the rule’s merits).
scope of agency power to alter regulations issued under congressional mandates. On the one hand, the Court emphasized in *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.* that “[a]n initial agency interpretation [of an ambiguous statute] is not instantly carved in stone,” and that an agency, “within the limits of [Congress’s] delegation,” may “rely on the incumbent administration’s views of wise policy to inform its judgements.” On the other hand, in *Motor Vehicle Manufacturers Ass’n v. State Farm Mutual Automobile Insurance Co.*, the Court delineated important limitations on the power of the National Highway Traffic Safety Administration (NHTSA) to alter discretionary automobile safety policies for political reasons.

While the Court noted the importance of deferring to “expert discretion” in both cases, the concept was especially relevant to the arbitrary and capricious standard of review that the Court applied to NHTSA’s decision in *State Farm*. This standard of review, which is mandated by section 706 of the Administrative Procedure Act (APA), requires a reviewing court to “hold unlawful” agency actions that are “arbitrary and capricious.” In *State Farm*, the Court distinguished arbitrary political choices from reasoned decisions that could plausibly be attributed to “a difference in view or the product of agency expertise.” Applying this standard, all nine Justices rejected NHTSA’s decision to rescind a prior administration’s automobile airbag regulations, where the Agency failed to offer even “one sentence” to explain why it had come to reject the safety benefits of airbags.

The Court split in a five-to-four vote, however, on NHTSA’s summary rejection of data that associated safety benefits with an alternative technology, namely, detachable automatic seatbelts. Justice White’s majority opinion rejected the Agency’s explanation as arbitrary and capricious, holding that the explanation was too superficial to constitute “the

32 *Id.* at 48 (quoting *Burlington Truck Lines v. United States*, 371 U.S. 156, 167 (1962)); *Chevron*, 467 U.S. at 865 (recognizing that judges “are not experts in the field” as one reason for deferring to agencies).
34 *Id.*
35 *State Farm*, 463 U.S. at 43 (emphasis added).
36 This holding also aligns with dictionaries that define “arbitrary” as reflecting “individual preference” or “tyranny” and capricious as “impulsive.” *Merriam-Webster, Capricious, MERRIAM-WEBSTER*, https://www.merriam-webster.com/dictionary/capricious (last visited Feb. 9, 2019) (arbitrary definitions 1.b–2.b.).
37 *State Farm*, 463 U.S. at 48–49; *Id.* at 57–58 (Rehnquist, J., concurring in part and dissenting in part) (agreeing that the Agency erred when it “gave no explanation at all” for “eliminating the airbags and continuous spool automatic seatbelt”).
product of reasoned decisionmaking." 38 On the other hand, Justice Rehnquist argued in a partial dissent that the Agency had engaged in a rational "assess[ment of] administrative records," and that its cursory analysis was sufficient in light of political concerns raised by a "change in administration." 39

The Supreme Court has not resolved the lingering tension between Justice Rehnquist’s call for greater deference to political will and Justice White’s insistence on reasoned decision making. The Court’s next major decision on agency change, FCC v. Fox, 40 which involved the prohibition of “fleeting expletives” from the airwaves, may suggest to some that the Court has moved to a more relaxed standard. But Fox did not involve the same type of “empirical evidence” as State Farm, 41 and Justice Scalia’s lead opinion in Fox studiously avoided any reference to Justice Rehnquist’s partial dissent in State Farm. 42 In Department of Commerce v. New York, 43 the Court’s most recent decision in the area, shifting coalitions of Justices likewise failed to settle on a single arbitrary and capricious standard of review. The Justices’ five-to-four decision to invalidate the Trump Administration’s addition of a citizenship question to the 2020 census revealed continued disagreement over the respective roles of political will and expert analysis in agency decisions. 44 Moreover, the broad rationale for expert agency decision making, which once commanded widespread support, has rested on shaky ground in recent decades.

Agency expertise was long considered an important justification for delegating decision making authority to agencies, and even early agencies such as the Interstate Commerce Commission were understood to exercise expert discretion within the narrow limits of legislatively established ends. 45 During the Progressive Era, Congress established the Federal Trade Commission, which gave the Commission very broad discretion and was thus consistent with Woodrow Wilson’s vision of a much broader role for agency expertise. 46 By the time of the New Deal, agency expertise had become the new orthodoxy, and, at least in the view of such luminaries as James Landis, it was agency expertise that justified Congress’s delegation of power to administrative agencies. While conceptions of the role of agency expertise varied during this time, all variations assumed that agencies would

38 State Farm, 463 U.S. at 52; see also Doremus, supra note 16, at 423 (explaining that State Farm requires analysis of relevant scientific evidence even “in the absence of an explicit legislative science mandate”).
39 State Farm, 463 U.S. at 59 (Rehnquist, J., concurring in part and dissenting in part).
41 Id. at 519.
42 Justice Scalia spoke for a plurality of the Justices when he rejected the view that “significant political pressure from Congress” justified heightened scrutiny of the Agency’s decision. Id. at 523.
44 Id. at 2571.

46 Id.
exercise expert discretion objectively and free from political influence. More recently, that has changed.

The idea that objective expertise supplies an adequate justification for delegations of broad power to administrative agencies has been under attack for various reasons since the late 1930s. Calls by the legal and business communities for increased procedural controls over administrative agencies culminated in the passage of the Administrative Procedure Act in 1946. By the 1960s and the 1970s, concerns over agency capture had further eroded support for the agency expertise rationale. Although Congress continued to delegate expert questions to agencies in new environmental and safety legislation in the 1970s, by then the objective expertise rationale for agency decision making had largely been discredited. Without any strong theoretical basis for the exercise of agency expertise, leading scholars began to argue that the justification for agency discretion rested in its capacity for advancing political concerns, especially those of the President. 47 As a result of this larger theoretical shift away from expertise and toward politics, it is not surprising that leading administrative law scholars have questioned State Farm’s majority holding and voiced support for regulatory change justified only by a new President’s political priorities. 48 This Article takes a contrary view and argues that expertise and reasoned analysis of relevant evidence still serve an essential purpose in agency decision making, even when they cannot point to a single, objective answer in a particular case.

The Article develops its argument for the importance of agency expertise in administrative change as follows. Part I recounts the extent to which raw politics have replaced expert analysis under the Trump Administration. Part II outlines the historical rise and fall of expertise as a general theoretical justification for delegations of power to administrative agencies. Part III introduces the science of administrative change. It offers a positive procedural account of administrative change and identifies the unique advantages of agency decision making. No other actor in our system is equally qualified to formulate regulatory policy involving dynamic questions of science, technology, or economics. Part IV describes the Justices’ divergent views on the importance of expertise in administrative change. Part V discusses the ongoing debate about the extent to which political will should be allowed to supplant expertise as a justification for an agency’s change in policy and shows how expert justifications for change provide a unique opportunity to increase the legitimacy and transparency of regulatory decision making. The Article concludes by arguing that courts should continue to insist on expert decision making and reasoned analysis of relevant record evidence to support changes in policy, regardless of whether the changes are intended to rollback or enhance the general level of

47 See Kagan, supra note 6, at 2320 (arguing that statutes giving discretion to executive branch officials should be interpreted as granting final decision making authority to the President).
48 See supra notes 9–11.
regulation. If, on the other hand, courts allow politics to supplant expert discretion, they will strip the regulatory system of the transparency and legitimacy that agency expertise provides.

I. THE TRUMP ADMINISTRATION HAS SUBSTITUTED POLITICAL WILL FOR EXPERT ANALYSIS

In the 2017 presidential transition, the Obama Administration prepared extensive briefing materials on the workings of the federal government and offered to make its officials available to meet with the Trump transition team.\(^\text{49}\) It is now well known that the Trump transition team ignored those materials, spurned opportunities to meet with Obama Administration officials, and displayed little interest in learning about the inner workings of the agencies they were about to begin running.\(^\text{50}\) Having campaigned against federal regulation, President Trump remained hostile to the agencies’ basic missions during the transition.\(^\text{51}\)

On President Trump’s first day in office, his Chief of Staff directed executive agency heads to freeze all pending, non-finalized regulations.\(^\text{52}\) In addition, the Chief of Staff urged a presumptive delay for all recently published rules with future effective dates to allow the new Administration to reconsider all “questions of fact, law, or policy” that the Obama Administration had decided in promulgating those regulations.\(^\text{53}\) Ten days later, President Trump issued an Executive Order directing agencies to

\(^\text{50}\) Few Trump transition officials appear to have made contact with outgoing officials. See MICHAEL LEWIS, THE FIFTH RISK 40 (2018) (“We had tried desperately to prepare them,” said Tarak Shah, chief of staff for the DOE’s $6 billion basic-science program. “But that required them to show up. . . . [T]hey didn’t [show up or] ask for even an introductory briefing.”).

\(^\text{53}\) Priebus, supra note 52.
eliminate two existing regulations for every new regulation they intended to promulgate, thus focusing regulatory efforts on the elimination of costs.54 Only a few months into his term, President Trump ordered agencies to rescind or revise the “most important Obama era rules” on environmental protection,55 including the carbon emissions limitations in the Clean Power Plan56 and the regulation of water pollution in the so-called Waters of the United States (WOTUS) Rule.57 The Administration also worked with Congress to permanently rescind fourteen recently adopted Obama-era regulations under the Congressional Review Act.58

President Trump’s agency heads embraced these policy directives. Many, such as former EPA Administrator Scott Pruitt, came to office with a history of hostility to the very laws and regulations they would be charged with enforcing.59 Other incoming Trump Administration officials also voiced hostility to the regulatory missions of the agencies they would be directing,60 and the low value they placed on professional analysis seems to have contributed to an early “exodus” of expert staff.61 President Trump’s agency heads made numerous decisions that prioritized political goals over expert analysis of data.62 Lisa Heinzerling has described these initial regulatory rollbacks as a “display of autocracy,

56 Exec. Order No. 13,783, 82 Fed. Reg. 16,093 (Mar. 28, 2017) (directing executive agencies to “immediately review existing regulations that potentially burden the development or use of domestically produced energy” and as “soon as practicable . . . publish for notice and comment proposed rules suspending, revising, or rescinding” the Clean Power Plan).
57 Exec. Order No. 13,778, 82 Fed. Reg. 12,497, § 2 (Feb. 28, 2017) (directing governing agencies to “publish for notice and comment a proposed rule rescinding or revising” the WOTUS Rule, “as appropriate and consistent with law”).
60 LEWIS, supra note 50, at 42 (noting that incoming Trump staff mocked regulatory work as “stupid”).
61 Id. at 50 (noting loss of expert staff); Short, supra note 10, at 1869 (predicting that a “political” framework could drive out “professional” or “expert” agency staff by “undermin[ing]” their “motivation” to work in a system that values expertise).
62 Cf. Coral Davenport, In the Trump Administration, Science is Unwelcome. So is Advice, N.Y. TIMES (June 9, 2018), https://www.nytimes.com/2018/06/09/climate/trump-administration-science.html (“The lack of traditional scientific advisory leadership in the White House is one example of a significant change in the Trump administration: the marginalization of science in shaping United States policy.”).
impulsivity, and jerry-rigged reasoning” that gave “little attention” to legal requirements of “process” or “reason giving.” In a number of early regulatory rollbacks, Trump Administration officials essentially made up their minds in advance by announcing mandatory delays without the deliberation required by standard rulemaking procedures. These standard procedures, known as notice-and-comment rulemaking, are a staple of introductory administrative law courses and are mandated by section 553 of the APA. Under the APA, agencies that wish to change an existing rule (or propose a new one) must (1) provide advance notice of the rule they are proposing, (2) “give interested persons an opportunity to participate in the rulemaking through submission of written data, views, or arguments,” and (3) thereafter provide a “general statement” of the rule’s “basis and purpose” (responsive to relevant and vital comments)—all before publishing a binding final rule in the Federal Register.

A rule that rolls back an existing regulation without going through the notice-and-comment procedure deprives the public of an opportunity to learn the reasons for an agency’s decision, let alone weigh in on their persuasiveness. The Second Circuit recently emphasized this point when it invalidated an NHTSA rule because the Agency did not follow notice-and-comment procedures before indefinitely delaying regulations that increased civil penalties for violating fuel economy standards. Those procedures, the court observed, “serve the public interest by providing a forum for the robust debate of competing and frequently complicated policy considerations having far-reaching implications” and by “foster[ing] reasoned decisionmaking.”

Not surprisingly, the first round of Trump Administration rollbacks has not fared well in the courts. In numerous cases, judges have struck down

---

62 Id. at 34 (discussing how many Trump Administration delays are unlawful “end run around the notice and comment process”). Id. at 16 (discussing decisions that “involved delaying or suspending the effective dates” of Obama era rules).

64 5 U.S.C. § 553(c) (2012).

65 Id.; see Nova Scotia Food Prods. Corp., 568 F.2d at 253 (requiring the Agency to respond to comment questioning the viability of the canned whitefish industry under the proposed rule).

66 5 U.S.C. § 553(d) (2012). The APA requires publication “not less than 30 days before [a rule’s] effective date.” Id.

68 Id.

overtly political rollbacks in which agencies have unlawfully bypassed notice-and-comment rulemaking. Courts have also invalidated rollbacks in which agencies “acted against [the agency’s] own scientific findings” without explanation, botched substantive legal requirements, or acted arbitrarily and capriciously by “entirely fail[ing] to consider the benefits” of rules they postponed. In at least one case, the Administration “tacitly conce[ded]” its error by initiating notice-and-comment procedures after its actions were challenged. Still, the agencies’ recent loss of scientists and other expert personnel may make it difficult for them to improve their analyses in the future. Many rollbacks in which the Trump Administration has used notice-and-comment procedures to change existing rules have only recently been finalized by the agencies. The Administration’s initial attempts to repeal two major environmental regulations—the Clean Power Plan and

challenged in court). While the District of Columbia Circuit generally affirmed the FCC’s rollback of net neutrality regulations, the court found that the FCC’s “anemic analysis” of alternative legal protections for competition “barely survive[d] arbitrary and capricious review.” Mozilla Corp. v. FCC, 940 F.3d 1, 59 (2019). The court also held that the FCC flunked arbitrary and capricious review based on its “disregard of its duty,” “scattered and unreasoned observations,” and “non-sequiturs” with respect to public safety concerns, pole attachments, and Lifeline subsidies for low-income consumers. Id. at 63, 65, 69, 86 (remanding without vacatur for reasoned analysis of these issues). See, e.g., Nat. Res. Def Council, 894 F.3d at 115 (rejecting argument that NHTSA had “good cause” to circumvent notice and comment procedure when it indefinitely delayed increase in civil penalties); Clean Air Council v. Pruitt, 862 F.3d 1, 9 (D.C. Cir. 2017) (vacating the EPA’s attempt to stay a Clean Air Act regulation without “comply[ing] with” the APA’s “requirements for notice and comment”); California v. U.S. Bureau of Land Mgmt., 277 F. Supp. 3d 1106, 1121 (N.D. Cal. 2017) (holding that the “Postponement Notice” issued without notice and comment procedures “was improper”); see also Buzbee, supra note 10, at 1413 n.327 (listing court “rejections of deregulatory actions” involving procedural shortcuts).

See, e.g., League of United Latin Am. Citizens v. Wheeler, 899 F.3d 814, 829 (9th Cir. 2018) (remanding matter “to the EPA with directions to revoke all tolerances [for the pesticide] chlorpyrifos,” after the EPA acted “against its own scientific findings”); rel’g en banc granted, 914 F.3d 1189 (9th Cir. 2019) (mem.) (indicating that “three-judge panel disposition in this case shall not be cited as precedent by or to any court of the Ninth Circuit”). Before the en banc panel could decide whether the court had subject matter jurisdiction over the EPA’s arguably non-final order, the EPA issued a subsequent order finalizing its determination, and the matter was referred back to the original three-judge panel. League of United Latin Am. Citizens v. Wheeler, 940 F.3d 1126, 1127 (9th Cir. 2019).

The Ninth Circuit invalidated the Administration’s rescission of DACA on these grounds. See Regents of the Univ. of Cal. v. U.S. Dep’t of Homeland Sec., 908 F.3d 476, 510 (9th Cir. 2018) (“The rescission of DACA—based as it was solely on a misconceived view of the law—is reviewable, and plaintiffs are likely to succeed on their claim that it must be set aside under the APA.”), cert. granted sub nom., Dep’t of Homeland Sec. v. Regents of the Univ. of Cal., 139 S. Ct. 2779 (2019).

U.S. Bureau of Land Mgmt., 277 F. Supp. 3d at 1122; see also Air All. Hous. v. EPA, 906 F.3d 1049, 1067–69 (D.C. Cir. 2018) (holding the EPA acted arbitrarily and capriciously when it failed to adequately explain its delay of the Chemical Disaster Rule by dismissing safety benefits as “speculative” and omitting discussion of factual findings related to harm the rule would prevent).

LEWIS, supra note 50, at 92, 115 (noting that new agency staff lacked “credentials” and displayed a “seeming commitment to scientific ignorance”).

See supra notes 1–2.
jurisdictional rules under the Clean Water Act—manifested an intention to impose swift regulatory rollbacks with minimal analysis. For both of these proposed repeals, the agencies’ opening notices outlined a bifurcated process in which the initial decision to rescind a rule would precede a promised rulemaking addressing the merits of substantive policy questions.\textsuperscript{79} These opening notices were only eleven to fifteen pages long, focused exclusively on the immediate rescission of the existing rules, and expressly invoked the authority of Executive Orders calling for regulatory rollbacks.\textsuperscript{80} The notices also emphasized the relevant agencies’ discretion to alter policies based on a “change in administrations” under either \textit{Chevron}\textsuperscript{81} or a recent District of Columbia Circuit opinion that relied on Justice Rehnquist’s partial dissent in \textit{State Farm}.\textsuperscript{82} Final decisions on these proposed rollbacks have only recently been issued.\textsuperscript{83} As some early efforts to delay existing regulations face judicial review, however, it is clear that even agencies employing notice-and-comment procedures have sometimes taken shortcuts, skipping over inconvenient scientific or economic data to achieve politically chosen ends.

These shortcuts have plagued the Administration’s leading deregulatory initiatives, including the EPA’s rule delaying the Obama Administration’s 2015 interpretation of the Clean Water Act in its “Waters of the United States” Rule (2015 Rule). The Clean Water Act, which is intended to restore and maintain “the chemical, physical, and biological integrity of the Nation’s waters,”\textsuperscript{84} requires the EPA Administrator to work with relevant state and federal agencies to regulate water pollution and set “criteria for water quality accurately reflecting the latest scientific knowledge” on “all identifiable” health and welfare effects.\textsuperscript{85} The scope of the relevant federal agencies’ authority to address water quality and pollution under the Clean

Water Act has long been unclear, and in 2006 a divided Supreme Court was unable to resolve the proper scope of federal jurisdiction over the pollution of tributaries and wetlands having some connection to “navigable waters.”

Seeking to provide needed clarity, the 2015 Rule relied on relevant “legal precedent,” “the best available peer-reviewed science,” and “the agencies’ technical expertise and extensive experience in implementing the CWA over the past four decades.”

President Trump issued an Executive Order targeting the 2015 Rule shortly after taking office. The Order urged the EPA and the Army Corps of Engineers to review the 2015 Rule to ensure that the goals of “promoting economic growth” and “minimizing regulatory uncertainty” were considered in addition to concerns about water pollution. President Trump directed the agency heads to “publish for notice and comment a proposed rule rescinding or revising” the 2015 Rule “as appropriate and consistent with law.” As William Buzbee has noted, the Order “went further” than an attempt to “tilt the agencies” against regulation; it attempted to direct the substantive outcome by ordering the “agencies to ‘consider interpreting the’ underlying statutory language ‘in a manner consistent with the opinion of Justice Antonin Scalia’ in Rapanos v. United States.”

The EPA and Army Corps of Engineers followed the President’s direction and initiated rulemaking proceedings to reconsider the merits of the 2015 Rule. The agencies’ initial March and July 2017 notices appeared to comply with the President’s directive, but failed to “grapple[] with ... past science” or to “proffer any analysis of the environmental impacts of dropping the Clean Water Rule.” In addition, while those merits proceedings were ongoing, the agencies used notice-and-comment procedures to promulgate a separate rule delaying the 2015 Rule’s applicability date (Delay Rule). The Delay Rule suggested that the agencies had already decided to reject the 2015 Rule on the merits, as it delayed the “applicability date” of the 2015 Rule until February 6, 2020.

The agencies emphasized that their Delay Rule was “separate” from the rulemaking proceeding designed to “revise” the “definition of ‘waters of the United States’”.

United States,” and that its purpose was to maintain the “status quo.”  
But they also acknowledged that the immediate effect of the Delay Rule was to return the law to that which existed before the 2015 Rule was promulgated: the EPA and Army Corps will administer the “scope of CWA jurisdiction ... exactly ... as it was administered prior to the promulgation of the 2015 Rule.” When implementing this suspension of the governing regulatory regime, the agencies made no attempt “to address ... the scientific record supporting the 2015 Rule.” Instead, the analysis underlying the Delay Rule omits any analysis of this scientific and economic information, cites the Executive Order calling for agencies to “minimiz[e] regulatory uncertainty” in their review of the 2015 Rule, and focuses on an immediate need for “clarity, certainty, and consistency” in the law.

Environmental groups challenged the Delay Rule as arbitrary and capricious in South Carolina Coastal Conservation League v. Pruitt, and, in August 2018, the district court held that the agencies’ refusal to “consider the merits of the [2015] rule” was arbitrary and capricious and lacked the “reasoned analysis” required by State Farm. The court determined that the agencies’ truncated notice-and-comment process showed a failure to consider the merits of the 2015 Rule before suspending it. The court explained that the 2015 Rule “received over one million comments” over a 200-day comment period, and that the rulemaking process itself involved “over four years of reviewing thousands of peer-reviewed scientific studies.” The Delay Rule, on the other hand, “received over 680,000 public comments in the few weeks that public comment was open.” The Delay Rule was “promulgated in mere months in a process that involved instructing the public to withhold substantive comments and did not consider any scientific studies.” The court found that the agencies’ refusal “to allow public comment and consider the merits of the WOTUS rule” precluded a “meaningful opportunity” to comment.

The court also rejected the agencies’ stated rationale for delay, which echoed the February 28, 2017 Executive Order’s call to minimize regulatory uncertainty. The agencies asserted “that the WOTUS rule has been ensnared

in litigation and its suspension would reduce ‘uncertainly [sic] and confusion’ in the regulated community [arising] from that litigation.” The court rejected this argument, holding that the lack of “reasoned analysis” and “meaningful opportunity” to comment on the merits rendered the Delay Rule arbitrary and capricious. The Trump Administration’s losses in court (perhaps coupled with new leadership at the EPA) also seem to have prompted the agencies to supplement the scope of issues considered in the merits docket seeking to undo the 2015 Rule. Not until a Supplemental Notice issued in the summer of 2018 did the agencies offer to “delve[] in more than a cursory manner into issues of science” raised by the 2015 Rule. The Administration took similar steps to supplement its analysis in the rulemaking designed to repeal the Clean Power Plan.

An insufficiently explained policy change also undermined the Trump Administration’s efforts to add a citizenship question to the 2020 decennial census. In Department of Commerce v. New York, the Supreme Court found that Secretary of Commerce Wilbur Ross, to whom Congress has delegated significant authority over the decennial census, did not “adequately explain[]” his decision to add a citizenship question to the 2020 census. Because of that failure, the Court held that the Secretary had acted arbitrarily and capriciously, and that the “District Court was warranted in remanding” the issue “to the agency.”

The Constitution requires that a decennial “enumeration” be made of the “whole number of persons in each State,” and the Census Bureau conducts the census through written questionnaires delivered to every known housing

113 Id. at 2576. The New York District Court held that Secretary Ross acted arbitrarily and capriciously because his decision contradicted record evidence and was pretextual. Id. at 2564. By the time the Supreme Court issued its decision, district courts overseeing parallel litigation in Maryland and California had also found Secretary Ross’s decision arbitrary and capricious on the same grounds. Krawitz v. U.S. Dep’t of Commerce, 366 F. Supp. 3d 681, 744–51 (S.D. Md. 2019); California v. Ross, 358 F. Supp. 3d 965, 1040–44 (N.D. Cal. 2019). On July 16, 2019, the Trump Administration “agreed to a court order that will formally block it from asking about citizenship on the 2020 Census.” Bob Von Voris, Trump Administration Agrees to Order Ending Census Fight, BLOOMBERG L. (July 16, 2019), https://news.bloomberglaw.com/us-law-week/trump-administration-agrees-to-final-order-ending-census-fight.
114 U.S. CONST. art. I, § 2, cl. 3; id. amend. XIV, § 2.
When households do not respond to the questionnaires, the Bureau must incur additional costs and resort to less accurate measures and extrapolated data. Historically, census questionnaires have included questions about the people to be counted as well as their number. Citizenship questions appeared on early questionnaires, but have not been universally distributed for over fifty years.

Secretary Ross’s decision to reinstate a citizenship question was not required by a presidential executive order and was tainted by procedural irregularities. These irregularities were not obvious on the face of the Secretary’s March 2018 memo in which he publicly announced the addition of the citizenship question. That memo explained that he “was acting at the request of the [DOJ], which sought improved data about citizen voting-age population for purposes of enforcing the Voting Rights Act.” The memo discussed several ways to gather improved citizenship data and recited that the Secretary weighed the option to “reinstate a citizenship question on the decennial census” alongside the option to model citizenship data from existing administrative records. According to the Secretary, he “carefully considered” the possibility that the citizenship question would depress the response rate, but determined that the existence of “limited empirical evidence” prevented him from “determin[ing] definitively” that the question would have this effect. He concluded that the “need for accurate citizenship data . . . outweigh[s] fears about a potentially lower response rate.”

Secretary Ross’s decision to include a citizenship question was contrary to the expert recommendation of the “Census Bureau, a statistical agency housed within the Department of Commerce.” The Bureau predicted that a citizenship question would reduce the accuracy of citizenship data in two ways: First, approximately 500,000 noncitizens “would answer the question falsely.” Second, “more than 13 million . . . people . . . would not answer the citizenship question even if it were asked.” The Secretary discounted these predictions as uncertain projections based on limited empirical evidence. Although the Secretary could have obtained additional evidence

by following “the Bureau’s ordinary practice of extensively testing proposed changes to the census questionnaire,” he did not do so. As the district court noted, the testing that the Secretary decided to forego reflects standard protocol under the Bureau’s Statistical Quality Guidelines, and it allows the Bureau “to assess” a new “question’s impact on self-response rates” for both general and subpopulations within the United States.

After multiple groups sued to block the citizenship question, it became clear that Secretary Ross’s 2018 memo failed to tell the whole story. At the “DOJ’s urging,” the government supplemented the administrative record with a new memo from the Secretary, “intended to provide further background and context regarding” his March 2018 memo; the new memo showed that the Secretary “had begun considering whether to add the citizenship question in early 2017.” Plaintiffs argued that the new memo “indicated that the Government had submitted an incomplete record of the materials considered by the Secretary.” The district court allowed Plaintiffs’ motions to compel the government “to complete the administrative record” and to take “discovery outside the administrative record.”

The most surprising development occurred after the oral arguments before the Supreme Court, when Plaintiffs called the Court’s attention to “newly discovered evidence.” According to Plaintiffs, this new evidence showed that “Dr. Thomas Hofeller, a longtime redistricting specialist, played a significant role in orchestrating the addition of the citizenship question to the 2020 Decennial Census,” with the purpose of “creat[ing] a structural electoral advantage” for “Republicans and Non-Hispanic Whites.” Hofeller’s role also suggested an undisclosed evidentiary basis for reinstating the citizenship question. Plaintiffs recounted that Hofeller conducted a 2015 study in which he concluded “that adding a citizenship question to the 2020 Census” would be “advantageous to Republicans and Non-Hispanic Whites” in redistricting. In addition, Plaintiffs asserted

that Hofeller orchestrated the DOJ’s request for a citizenship question, and that “the letter that DOJ eventually sent to Commerce in December 2017 . . . bears striking similarities to Dr. Hofeller’s 2015 study.”\textsuperscript{135}

While the Court did not address this new evidence in its decision, it broke the arbitrary and capricious standard of review inquiry into two discrete parts regarding Secretary Ross’s explanation for his action.\textsuperscript{136} The first was whether the Secretary’s “course of action was . . . supported by the evidence before him,” and the second was whether “his stated rationale was pretextual.”\textsuperscript{137} Different coalitions of Justices reached different conclusions on the two questions. Chief Justice Roberts, joined by Justices Kavanaugh, Gorsuch, Thomas, and Alito, found that Secretary Ross’s decision was not arbitrary and capricious because it had sufficient evidentiary support: “The Secretary justifiably found the Bureau’s analysis” and recommendation against the citizenship question “inconclusive” and reasonably “determined that reinstating a citizenship question was worth the risk of a potentially lower response rate.”\textsuperscript{138} Justice Breyer, joined by Justices Kagan, Sotomayor, and Ginsburg, dissented, finding that the Secretary “failed to consider” many “important aspect[s] of the problem.”\textsuperscript{139} In particular, the dissent found that the Secretary erred by discounting evidence that a citizenship question would “harm the accuracy of citizenship data”\textsuperscript{140} and by making an “immediate decision rather than wait[ing] for testing” that would provide further evidence on the question’s likely effects.\textsuperscript{141}

On the second issue, Chief Justice Roberts found that Secretary Ross acted arbitrarily and capriciously because the stated rationale for his decision was pretextual. In a part of the opinion joined by Justices Breyer, Kagan, Sotomayor, and Ginsburg, Chief Justice Roberts held that the Secretary’s “sole stated reason” for his action—the Voting Rights Act “enforcement rationale”—appears “to have been contrived.”\textsuperscript{142} In particular, the Secretary’s stated rationale conflicted with evidence showing that he “was determined to reinstate a citizenship question from the time he entered office,” and that he “adopted the Voting Rights Act rationale late in the

process. Based on the Secretary’s failure to adequately explain the true reason for his decision, the Court affirmed the district court’s decision to remand the matter to the Secretary. Justices Kavanaugh, Gorsuch, and Thomas dissented to that part of the decision.

In sum, the Trump Administration’s regulatory changes reflect the President’s attempt to effectuate his campaign promises and exert strong political control over regulatory policies. Although extreme, these efforts align with a model of administrative decision making that accords greater legitimacy to agency decisions when made under the direct control of an elected President. Under the “political control” model, the primary remedy for disheartened citizens is thought to rest in the ballot box. The Trump Administration’s efforts at politically driven change clash, however, with the courts’ initial applications of mandatory procedural rules and arbitrary and capricious review. Many of the Administration’s outright refusals to consider the merits of existing regulations are so extreme that they run afoul of the unanimous holding of State Farm. Other judicial decisions have rejected policies that were supported by incomplete or cursory analyses. These decisions illustrate the importance of a competing theoretical model in which agency decisions gain broader legitimacy and transparency from expert analysis of relevant economic, scientific, or technological evidence.

II. THE HISTORY OF AMERICAN ADMINISTRATIVE LAW REFLECTS CHANGING VIEWS OF AGENCY EXPERTISE

This Article is principally concerned with administrative change. But that topic presupposes the existence of agencies, and it also raises questions about the nature of agencies, their proper role, and their claims to legitimacy. Those questions, in turn, raise issues about the nature of technical and scientific expertise and the place of such expertise in democratic government. This Section briefly describes the history of administrative agencies in the theory and practice of American government and the persistent, but changing role that technical and scientific expertise has played in it.

Most, if not all, theories of government recognize that laws are not self-interpreting or self-executing, but require interpretation and execution. Madison made this point well in Federalist 37:

All new laws, though penned with the greatest technical skill, and passed on the fullest and most mature deliberation, are considered as more or less obscure and equivocal, until their

meaning be liquidated and ascertained by a series of particular discussions and adjudications. Besides the obscurity arising from the complexity of objects, and the imperfection of the human faculties, the medium through which the conceptions of men are conveyed to each other adds a fresh embarrassment.1

Like judges, public officials must routinely “liquidate” and ascertain the meaning of laws.147 Sometimes their conclusions will be subject to judicial review, but often the officials will have the last word.148

The Constitution speaks directly to the execution of the laws when it charges the President with the duty to “take care that the laws be faithfully executed.”149 The Constitution makes no specific provision for executive branch offices, except for those of the President and the Vice President, but the Founders clearly contemplated that the work of government would require Congress to create various departments and executive offices.150 Indeed, the Constitution specifically acknowledges that understanding by providing that the President “may require the opinion, in writing, of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices”151 and by establishing appointment requirements for “officers” and “inferior officers.”152 The First Congress immediately created several executive departments,153 and later Congresses created additional executive

---

146 THE FEDERALIST NO. 37 (James Madison).
148 For example, the Office of Legal Counsel of the Department of Justice often provides legal advice to the executive branch, but much of that advice will never be tested in court. See H. JEFFERSON POWELL, CONSTITUTIONAL CONSCIENCE: THE MORAL DIMENSION OF JUDICIAL DECISION 134 n.2 (2008) (“Though these tasks remain vested as a formal matter in the attorney general, they are now performed in practice almost exclusively by subordinate officials within the Justice Department, in particular by the assistant attorney general who heads the Office of Legal Counsel.”).
149 U.S. CONST. art. II, § 3.
150 George Washington wrote that, because of “‘[t]he impossibility that one man should be able to perform all the great business of the State,’ the Constitution provides for executive officers to ‘assist the supreme Magistrate in discharging the duties of his trust.’” Free Enter. Fund v. Pub. Co. Accounting Oversight Bd., 561 U.S. 477, 483 (2010) (quoting 30 THE WRITINGS OF GEORGE WASHINGTON 334 (John C. Fitzpatrick ed., 1939)).

152 U.S. Const. art. II, § 2, cl. 2.
departments and agencies, charging them with specific statutory duties. In 1887, Congress created the Interstate Commerce Commission, which is generally thought to mark "the first institutionalization of the regulatory state."

It was generally understood that those who execute the laws, whether positioned within the executive branch or in an independent agency, should have some degree of relevant specialized knowledge. The Secretary of the Treasury must understand the world of finance and banking, just as members of the Interstate Commerce Commission could not have been effective unless they understood the railroad industry. One difference, of course, is that the Secretary of the Treasury reports to the President and serves at his pleasure, while members of independent agencies like the Interstate Commerce Commission do neither. From the beginning, questions were raised about the fit of such agencies into the tripartite structure of American constitutional government.

Institutionally, agencies raise important issues concerning the relationship of expertise and political power in our form of government. On the one hand, political power derives from the people and must be exercised for their benefit by their elected representatives and agents, within the framework established by the Constitution and laws. On the other hand, government does not exist solely to give effect to the will of the people, but to provide for the general welfare, which requires such things as a sound economy, an effective national defense, clean air and water, healthful living conditions, and the recognition of human dignity. Securing those benefits requires technical expertise and rational, fact-based decision making. Decisions that are based on false factual premises or faulty theories may inure to the benefit of certain stakeholders, but they are more likely to frustrate than further the general welfare. And many of the most important decisions regarding the general welfare cannot be made on merely technical

154 See Eric Foner, Reconstruction 68-69 (1988) (discussing the Bureau of Refugees, Freedmen, and Abandoned Lands, or Freedmen’s Bureau, which was established in 1865 in aid of Reconstruction); see also John Hope Franklin, Reconstruction After the Civil War 36-39 (1961) (same).

155 Richard H. Pildes & Cass R. Sunstein, Reinventing the Regulatory State, 62 U. CHI. L. REV. 1, 25 (1995) (“[I]f Congress has conferred the relevant authority on an agency head, then “the President has no authority to make the decision himself”); see also Thomas O. Sargentich, The Administrative Process in Crisis—The Example of Presidential Oversight of Agency Rulemaking, 6 ADMIN. L.J. 710, 716 (1993) (“[T]he agency head ultimately is to decide what to do.”).

157 See, e.g., Humphrey’s Ex’r v. United States, 295 U.S. 602, 625 (1935) (noting that the Commission was not subject to direction by anyone in government).
grounds. They often involve polycentric problems that necessarily involve value judgments and allocations of scarce resources amongst competing goods. When that is the case, the democratic deficit of agencies comes to the fore. For that reason, and over time, American public law has been concerned with giving effect both to the political will of the people’s representatives and agents and to the people’s fundamental interest in having governmental decisions made on a rational basis supported by the best evidence available. They that justify governance by unelected agencies have assigned different weights to these competing concerns over time.

The Interstate Commerce Act exemplifies one of the earliest justifications for administrative agencies. When the Interstate Commerce Commission was established in 1887, the prevailing view was that “the legislature would decide all questions of policy and establish clear standards and goals,” while “[t]he essential task of bureaucratic officials was to find the most efficient means to implement clear, legislatively elaborated ends.” In other words, the role of administration was to give concrete effect to the will of Congress. This view of administration has been called the “rule of law,” “delegation,” or “transmission-belt” theory. Ernst Freund, an early proponent of this view, thought that the “most important point in the development of administrative law is the reduction of discretion.” Consequently, the “appropriate sphere of delegated authority is where there are no controversial issues of policy or . . . opinion.” Freund did not think that the actual delegation of authority to the Interstate Commerce Commission was consistent with the “transmission-belt” theory: it was “anomalous,” he thought, “to delegate powers to set reasonable rates; in such areas, resolution of distinct issues should be incorporated in statutory provisions.” His reservations were not unfounded. “[T]he subsequent experience of railroad regulation cast severe doubt on the ability of general

rules or standards to provide serious guidance for the detailed and complex
tasks involved in administrative regulation.\textsuperscript{164} It became clear, for example,
that ratemaking simply involved “too many variables to be effectively
limited by general criteria.”\textsuperscript{165} More generally, “[t]he delegation doctrine
soon came to be regarded as too crude and formalistic to serve the function
of limiting administrative discretion. It depended on a theory of language
and legal reasoning that supposed that general propositions could actually
decide concrete cases.”\textsuperscript{166} Nonetheless, as Morton Horwitz has noted, the
“delegation [or transmission-belt] theory of administrative law” would
provide the formal basis for “legitimat[ing] the exercise of bureaucratic
power” for the next fifty years.\textsuperscript{167}

Even in 1887, however, Woodrow Wilson was already championing a
different approach. Contrary to Freund’s “narrow discretion” theory, Wilson
thought that “large powers and unhampered discretion” were “the
indispensable conditions of [administrative] responsibility,” and, indeed, the
very “essence of administration.”\textsuperscript{168} By 1914, Wilson’s view seems to have
won out in practice, as Congress created the Federal Trade Commission and
gave it “a blank check . . . to eliminate unfair competition.”\textsuperscript{169} The Supreme
Court soon weighed in on such broad grants of discretion by formulating a
new non-delegation doctrine—one that simply required Congress to specify
an “intelligible principle” to guide the exercise of administrative or
executive discretion.\textsuperscript{170}

By the time of the New Deal, “the scope of federal administrative
regulation [had] increased geometrically,”\textsuperscript{171} and proponents of the
administrative state were no longer justifying delegations of authority under

\textsuperscript{167} Id. at 216.

\textsuperscript{168} Jaffe (1973), supra note 163, at 1185 (quoting Woodrow Wilson, The Study of Administration,
2 Pol. Sci. Q. 197, 213 (1887)). With the advantage of much hindsight, Jaffe found both Wilson’s and
Freund’s views unsatisfactory. Id. at 1183, 1186 (concluding that Wilson’s concept depended on an
overly broad and underdetermined concept of “‘regulating’ in the ‘public interest,’” while Freund’s view
of “a more or less insulated, nonpolitical, expert hierarchy acting pursuant to an authoritative statement
of ends and means” was “very ill-conceived”).

\textsuperscript{169} HORWITZ, supra note 156, at 216. Woodrow Wilson was the President who signed the Federal
Trade Commission Act.

\textsuperscript{170} J.W. Hampton, Jr. & Co. v. United States, 276 U.S. 394, 409 (1928) (“If Congress shall lay
down . . . an intelligible principle to which the [executive] is directed to conform, [that] is not a forbidden

\textsuperscript{171} HORWITZ, supra note 156, at 223.
the “transmission-belt” theory. In his Storrs Lectures, James Landis articulated a vision of administrative government much closer to Wilson’s model of “large powers and unhampered discretion.” According to Landis, regulation required both specialization and “a method that calls upon other sciences to provide the norms.” It was agency expertise that gave “unelected administrators legitimacy to engage in regulatory tasks.” In “a joyous celebration of the virtues of ‘expertness,’” Landis argued that, “[w]ith the rise of regulation, the need for expertness became dominant.”

This regulatory expertise was not limited to “knowledge of the details of [the industry’s] operation.” It also included accommodation of changing conditions through the “ability to shift requirements” and “the pursuit of energetic measures upon the appearance of an emergency.” Landis further extolled the virtues of “‘practical’ judgment which is based upon all the available considerations and which has in mind the most desirable and pragmatic method of solving that particular problem.”

The Supreme Court’s validation of agency expertise and independence bolstered Landis’s view. In Humphrey’s Executor v. United States, the Court found that:

[T]he language of the [Federal Trade Commission] act, the legislative reports, and the general purposes of the legislation as reflected by the debates, all combine to demonstrate the

172 Stewart, supra note 160, at 1677 (“[A]fter the delegation by New Deal Congresses of sweeping powers to a host of new agencies under legislative directives cast in the most general terms, the broad and novel character of agency discretion could no longer be concealed behind . . . labels [such as quasi-legislative or quasi-judicial].”).

173 Louis L. Jaffe, James Landis and the Administrative Process, 78 Harv. L. Rev. 319, 319–20 (1964) (hereinafter Jaffe (1964)) (“Landis . . . had served successively as a member of the Federal Trade Commission, member of the Securities and Exchange Commission, and Chairman of the Securities and Exchange Commission . . . [His Storrs lectures were] a celebration, a defense, and a rationalization of the magnificent accomplishment in which he had played so brilliant a part.”). Landis also served as Dean of Harvard Law School. Id.

176 Id.

177 LANDIS, supra note 174, at 23.

178 Id.

179 Id. at 23–24. Landis’s understanding of expertise does not reflect the contemporary view that many policy questions cannot be decided by expertise alone. See infra text surrounding notes 368–70 (discussing Williamson’s decision-tree analysis wherein he notes that the harmful effects of certain carcinogens found in foods may be outweighed by the benefits).

180 LANDIS, supra note 174, at 33. Landis insisted that “resort to the administrative process is not, as some suppose, simply an extension of executive power.” Id. at 15. Instead, “the administrative differs” because the “scope of its powers . . . presents an assemblage of rights normally exercisable by government as a whole.” Id.
Congressional intent to create a body of experts who shall gain experience by length of service—a body which shall be independent of executive authority, except in its selection, and free to exercise its judgment without the leave or hindrance of any other official or any department of the government.\textsuperscript{181}

According to the Humphrey’s Executor Court, Congress intended for the Commission to “act with entire impartiality”; it was “charged with the enforcement of no policy except the policy of the law.”\textsuperscript{182} In addition, “[the Commission’s] duties are neither political nor executive,” its members “are called upon to exercise the trained judgment of a body of experts ‘appointed by law and informed by experience,’” and it “should not be open to the suspicion of partisan direction.”\textsuperscript{183} The Court concluded that the commissioners did not serve at the pleasure of the President.\textsuperscript{184}

Big businesses and their lawyers soon challenged the expertise model. An American Bar Association committee chaired by Roscoe Pound\textsuperscript{185} sounded the alarm about “administrative absolutism”—“a highly centralized administration . . . under complete control of the executive . . . relieved of judicial review and making their own rules.”\textsuperscript{186} The committee thought the administrative state was eroding ancient rights, particularly procedural rights; displacing the courts from their proper role;\textsuperscript{187} and threatening the rule of law itself.\textsuperscript{188} They were not entirely wrong. As Professor Horwitz has observed, “between 1910 and 1940, the expertise justification of authority resulted in the elimination of elaborate procedural protections in judicial

\begin{flushright}

\textsuperscript{182} Id. at 624.
\textsuperscript{183} Id. at 624–25.
\textsuperscript{184} Id. at 632 (explaining that an officer could only be removed for a cause “named in the applicable statute”).
\textsuperscript{185} Pound was one of the foremost legal scholars of the era. See Arthur E. Sutherland, The Law at Harvard: A History of Ideas and Men, 1817–1967, at 236–38 (1967) (providing an overview of Pound’s life and accomplishments).
\textsuperscript{186} Roscoe Pound, Report of the Special Committee on Administrative Law, 63 Rep. A.B.A. 331, 343 (1938). Interestingly, Pound places agencies within the “complete control of the executive,” notwithstanding their ostensible legal independence. Pound aligned with the legalism of A.V. Dicey, who “perceived [administrative law] as a hotbed of discretion and coercion, [which] posed a major threat to the rule of law ideal.” Horwitz, supra note 156, at 221.
\textsuperscript{187} As of 1938, “the Supreme Court likened agencies to legislatures for purposes of judicial review,” applying a minimal standard akin to “rationality review.” Watts, supra note 9, at 15 (citations omitted); see also Richard J. Pierce, Jr., Administrative Law 81 (2d ed. 2008) (“[A]n agency need[s] no evidence, no record, and no statement of reasons to support a rule.”).
\textsuperscript{188} That view was also popular among classical liberal economists, such as Friedrich Hayek, who characterized the rule of law in formalist terms, as “mean[ing] that government in all its actions is bound by rules fixed and announced beforehand—rules which make it possible to foresee with fair certainty how the authority will use its coercive powers in given circumstances and to plan one’s individual affairs on the basis of this knowledge.” Friedrich A. Hayek, The Road to SERFDOM 72 (1944) (citation omitted).
\end{flushright}
proceedings.” As procedures were simplified, the elite bar not only perceived a threat to the interests of their wealthy business clients, who were often at odds with New Deal policies, but also feared their own possible redundancy. As one recent commentator has noted, “[p]rimarily, politics motivated the reform attempts, not scientific truth. The battle over administrative reform was a fight for the life of the New Deal . . .” Much more was at stake, however, than the frustrations and self-interest of elite lawyers and their wealthy clients. Also at play was “[a] declining faith in the ability of experts to produce scientific, neutral, and apolitical solutions to social and legal questions.”

The Pound Committee’s 1938 Report was only the opening salvo in the war against expert agencies. In December 1940, Congress attempted to place substantial limits on agency power when it passed the Walter-Logan Bill, which President Roosevelt promptly vetoed. During this time, “disputes over questions of administrative law became thoroughly intertwined with raging political struggles over the legitimacy of the regulatory state.” The ultimate passage of the APA in 1946 reflected a truce that accommodated Pound’s legalist mentality as well as “the dialectical relationship between expertise theory and proceduralism in twentieth-century American legal thought.” In other words, the APA recognized the importance of expertise, but also provided procedures to discipline agency action.

Among other things, the APA introduced notice-and-comment rulemaking, which K.C. Davis thought was one of the greatest inventions of modern government. Although the APA required that rules include a

192 HORWITZ, supra note 156, at 233.
193 President Roosevelt pointed out that the bill would have forced administrative agencies “into a single mold which is so rigid, so needlessly interfering, as to bring about a widespread crippling of the administrative process.” PRESIDENT OF THE U.S., PROVIDING FOR THE EXPEDITIOUS SETTLEMENT OF DISPUTES WITH THE UNITED STATES, H.R. DOC. NO. 986, at 4 (1940). In addition, “[w]herever a continuing series of controversies exist between a powerful and concentrated interest on one side and a diversified mass of individuals, each of whose separate interests may be small, on the other side, the only means of obtaining equality before the law has been to place the controversy in an administrative tribunal.” Id. at 3. Congress was unable to override the veto. Shepherd, supra note 190, at 1630.
194 HORWITZ, supra note 156, at 231.
195 Id. at 233. Walter Gellhorn, who participated in these events, has observed that, “what was forestalled was more significant than what was enacted.” Walter Gellhorn, The Administrative Procedure Act: The Beginnings, 72 VA. L. REV. 219, 232 (1986).
196 See KENNETH CULP DAVIS, ADMINISTRATIVE LAW IN THE SEVENTIES, at ix, xvii (1976) (noting that even when the APA did not require a notice and comment procedure, the common law may have done so, and praising “judge-made administrative law”); Kagan, supra note 6, at 2262 (remarking that the APA was intended to “curtail[] the sway of administrative officials by subjecting . . . rulemakings
“concise . . . statement of . . . basis and purpose,” thereby providing courts with a basis for striking down agency rules as arbitrary or capricious under section 706(2)(A) of the APA,” agencies continued to receive an “extraordinary level of deference.” As late as 1958, the procedural demands on rulemaking were “not great,” reflecting an understanding that “agency action was ‘expert’” and somewhat “removed from politics.”

In the 1960s and 1970s, concerns about “agency capture” brought the agency expertise model into question once more. Even Landis began to express doubts, and Louis Jaffe offered a sober response to Landis’s previously exuberant defense of the New Deal. First, Jaffe recounted the New Deal’s “paradigm of broad delegation” in which agencies derived legitimacy from an “assumed comprehensive body of expertise . . . informed by the values of the New Deal.” Jaffe then noted, ironically, that, “[a]s long as New Dealers were in control and . . . public opinion supported them, the new agencies performed very well as judged by those who created them.” He concluded by noting that the failures of existing agencies had made them prey to “agency capture”—a theory positing that agencies become the “captives” of the industries they are charged with regulating.
This concern illuminated the weaknesses of Landis’s model of agencies immune from any influence except for expert knowledge:

[T]he Landis model, if taken as a generalization for all administrative agencies at all times, makes certain untenable assumptions: the existence in each case of relevant, value-free concepts, and an administration located at any given moment of time outside the political process... or insulated from the power structure.  

Jaffe’s extended reconsideration of Landis’s “broad delegation” model not only came in the midst of debates about agency capture, but also at a time of renewed concern about broad agency discretion and the effectiveness of various mechanisms for combatting it. It was widely recognized that discretion was necessary to give proper scope to the exercise of expert judgment, but it was also understood that limits were necessary if the basic values of representative government and the rule of law were to be respected. “[T]he prevalent ‘expertise-based’ model of agency decisionmaking, view[ing] agencies as professional, apolitical experts charged with pursuing the public interest, began to fade away.” As that happened, the courts perceived the need to guard against capture by ensuring broader public participation and a more muscular form of judicial review—one aimed at ensuring that agencies faithfully exercised the discretion that Congress had granted to them.

Various prominent judges on the D.C. Circuit crafted a ramped up version of “arbitrary and capricious” review—called “hard look” review—that enabled courts to scrutinize agency decisions and to ensure that the public interest was being served... Applying this more stringent level of review, courts began to scrutinize the substantive elements of agency decisions to ensure that agencies gave adequate consideration to the relevant data and gave reasoned explanations to support their decisions.

Courts and scholars struggled to find ways to limit agency discretion and ensure agency legitimacy. In addition to substantive review, the courts began to impose additional procedural requirements designed to test whether an
agency had actually done the work that Congress had required it to do. These additional rulemaking requirements included directives that agencies disclose the significant relevant data in their possession; that they submit draft rules for a second round of comment if significant changes were made; and that they provide statements of basis and purpose that addressed all significant comments and disclosed in some detail the agency’s reasoning.

Although the Supreme Court ultimately held, in Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, Inc., that the courts had no authority to impose procedural requirements in addition to those prescribed by the APA and other relevant statutes, the remaining substantive requirements of “hard look review” still “exact[ed] a price.” “[P]aper hearings’ generated mammoth records and ‘concise general statement[s] of basis and purpose’ expanded into the hundreds of pages to meet the demands of ‘hard look review.’ As a result, rulemaking became more and more expensive to complete . . . .

In addition, the sheer cost of participation in such potentially expensive rulemaking proceedings undercut the possibility of broad public participation. Without regard to whether wealthy business interests could actually “capture” an agency, it was clear that their well-financed voices could at least drown out all but their most well-resourced opponents. The courts no longer imposed additional rulemaking procedures, but the Supreme Court embraced hard look review in State Farm in 1983. State Farm’s “burden of explanation” demands that agencies disclose their reasoning with greater transparency than did past conceptions of judicial review.

Some scholars, including Louis Jaffe, thought that the solution to excessive agency discretion was for Congress to legislate with greater specificity. To show that Congress was capable of doing so, Jaffe pointed to

---

209 AMAN, supra note 207, at 34–35 (imposing a higher standard of review upon agencies, “requiring that agencies explain the links between the congressionally expressed belief in progress and the reasonableness of the regulation being reviewed”).

210 Strauss, supra note 199, at 756–57.

213 See, e.g., Stewart, supra note 160, at 1712 (“The viability in practice of such a pluralist theory of legitimacy is challenged at the outset by the predominant contemporary critique of the administrative process: that agencies are biased in favor of regulated and client groups, and are generally unresponsive to unorganized interests.” (footnote omitted)).

214 Id. at 155 (noting that new demands of review required that an agency justify its decisions by addressing factors relevant to its decision).
the “monumental detail of the tax code.”216 But Jaffe failed to recognize that the limited resources available to Congress made “monumental detail” unattainable in more than a few areas. In addition, some regulatory problems may be more scientifically or technically complex and dynamic than tax policy, and Congress may lack the ability to legislate with the expertise and frequency required for “monumental detail” in those areas.217 In any event, Congress made no effort to take up Jaffe’s invitation.218

If tax policy once represented the zenith of technical complexity in government regulation, it was soon displaced by the health and safety legislation of the 1960s and 1970s. Administering this legislation presented even more difficult questions of science and technology, as well as equally difficult questions of public policy and resource allocation. These issues were controversial because of the huge private costs associated with the alleviation of risks, the scientific uncertainty and difficulty of quantifying the precise benefits that might flow from various regulatory approaches, and the fact that resolutions of these questions were necessarily provisional and might be rendered obsolete by future advances in knowledge.219 Congress lacked the kind of in-house expertise necessary to address the myriad scientific, technical, and economic fields implicated by this new generation of regulatory statutes.220 Nor could Congress monitor the rapid and frequent changes in relevant scientific knowledge, let alone amend legislation quickly enough to address these changes in an effective way. To accomplish Congress’s objectives, a broad delegation of authority seemed necessary. Thus, for example, the Occupational Safety and Health Act directed the Secretary of Labor to adopt regulations that would ensure, to the extent feasible, that exposure to hazards in the workplace does not harm workers’

216 Jaffe (1973), supra note 163, at 1189–90 (“The monumental detail of the tax code suggests that Congress can, and does, legislate with great specificity when it regards a matter as sufficiently important.”).

217 When Jaffe was writing in 1973, the seniority system was still largely entrenched in Congress, and committee members, especially chairs and ranking members, often had substantial expertise in the substantive policy areas within their jurisdictions. See George Goodwin, Jr., The Seniority System in Congress, 53 AM. POL. SCI. REV. 412, 412 (1959).

219 See Doremus, supra note 16, at 450 (discussing the additional regulatory changes Congress should make).

health.\textsuperscript{221} Other statutes contained similarly broad mandates,\textsuperscript{222} which posed new problems for those concerned with broad delegations of authority to administrative agencies.

Ironically, just as new agencies began to implement the broad mandates contained in this new generation of regulatory statutes,\textsuperscript{223} Congress and the President started to undo earlier regulatory schemes, including the Interstate Commerce Act and the Civilian Aviation Act.\textsuperscript{224} The push for deregulation came from scholars as well as influential business leaders who preferred not having to do business under the eyes of regulators. They found a receptive audience in the White House.\textsuperscript{225} For some, that push reflected a widely shared view that economic regulation of transportation industries no longer worked.\textsuperscript{226} For others, however, the push was part of a more fundamental shift and the emergence of a new set of federal regulatory principles: that free market principles should usually prevail over regulation; that regulation should generally be disfavored as an improper interference with the market; that proponents of regulation should carry the burden of demonstrating the need for regulation; and that the ultimate questions of whether to regulate, how much to regulate, and the form that the regulation should take require a careful evaluation of costs and benefits.\textsuperscript{227} In a broader sense, the

\textsuperscript{222} See, e.g., Wagner (1995), supra note 25, at 1618 n.15 (“Science-based regulations are typically based on a vague statutory mandate that requires the agency to set standards or take action at the point at which a chemical substance presents or will present an unreasonable risk of injury to health or the environment.” (internal quotation marks omitted)).
\textsuperscript{224} Deregulation began in earnest with President Carter’s deregulation of the trucking and airline industries and accelerated under President Reagan.
\textsuperscript{225} See AM. BAR ASS’N COMM’N ON LAW & ECON., FEDERAL REGULATION: ROADS TO REFORM 79–80 (1979) (calling for greater presidential oversight to avoid duplication and decrease regulatory costs); Lloyd N. Cutler & David R. Johnson, Regulation and the Political Process, 84 YALE L.J. 1395, 1399, 1409, 1417 (1975) (advocating for presidential intervention and oversight of agencies).
\textsuperscript{226} See Cutler & Johnson, supra note 225, at 1396 n.4 (1975) (noting that the “Council of Economic Advisors’ Annual Report suggested that the deregulation of transportation might have to be considered ‘a matter of urgent national priority’”).
\textsuperscript{227} Cost-benefit analysis had long been a prominent feature in other areas of law. See EDWARD M. GRAMELICH, A GUIDE TO BENEFIT-COST ANALYSIS 2, 3 (2d ed. 1990) (noting the use of cost-benefit analysis by many Presidents and in a variety of different areas of regulation). Its use in regulation has been extensively documented by Cass Sunstein. See CASS R. SUNSTEIN, SIMPLER: THE FUTURE OF GOVERNMENT 167–68 (2013) (providing examples of the government’s use of cost-benefit analysis in enacting new regulations); Cass R. Sunstein, The Office of Information and Regulatory Affairs: Myths and Realities, 126 HARV. L. REV. 1838, 1858 (2013) (explaining that “[i]n popular and academic discussions of the OIRA process, a great deal of attention is devoted to cost-benefit analysis” (footnote omitted)); Cass R. Sunstein, Empirically Informed Information, 78 U. CHI. L. REV. 1349, 1364 (2011) (noting that the problem with the current system is that most regulations are only subject to cost-benefit
requirement that regulations be justified in terms of their respective costs and benefits would provide another means by which to limit broad statutory grants of discretion to agencies. Indeed, by the late 1970s, some proponents of cost-benefit analysis argued that this analysis should be treated as an implied term in federal regulatory statutes. This move toward quantification would also call into question the individual agencies’ resolution of regulatory matters and embellish the credentials of a competing decisionmaker: the Office of Management and Budget (OMB). As a separate entity within the Executive Office of the President (EOP), the OMB had special expertise in cost-benefit analysis and provided a means for subjecting agencies to more centralized presidential control.

The drive for presidential control of agency policymaking has been the most important development in administrative law in recent decades. In 1996, Peter Strauss noted that, “the Carter, Reagan, and Bush administrations were characterized by increasingly stringent efforts to gain presidential control over rulemaking in the agencies.” More recently, in 2010, Strauss wrote that, “[t]he development of aggressively centralized presidential oversight, even control, of executive agency rulemaking has given . . . new prominence” to the clash between technocratic and political views of agency action. Thus, at the same time that recent Presidents have issued executive orders requiring agencies to engage in cost-benefit analysis, analysis before they are implemented). But see Riccardo Rebonato, Taking Liberties: A Critical Examination of Libertarian Paternalism 1, 2 (2012) (offering libertarian paternalism as a “Third Way”).

See, e.g., Indus. Union Dep’t. AFL-CIO v. Am. Petroleum Inst., 448 U.S. 607, 639 (1980) (rejecting the view of “industry representatives” that Congress’s use of the terms “reasonably necessary” and “feasible” in the Occupational Safety and Health Act to describe required safety standards should be disregarded or reinterpreted to require “the Agency to quantify both the costs and the benefits of a proposed rule”).

Strauss, supra note 199, at 760.

presumably putting rulemaking on a firmer analytical basis, the same Presidents have increasingly sought to insert their own policy views, usually through OMB’s Office of Information and Regulatory Affairs (OIRA), into specific rulemaking proceedings. The two moves may be consistent, from the viewpoint of maximizing executive power, but they seem inconsistent at another level because of the conflict between the “expertise” and “political” models of decision making.

From the very beginning, the Trump Administration has been particularly aggressive both in asserting centralized control over agency decision making and in insisting that science take second seat to politics. But the principal theorist for this view of presidential control of administrative action was then-Professor Elena Kagan. Following her time in the Clinton White House, Kagan wrote a lengthy justification for President Clinton’s control of administrative policy. In Presidential Administration, Kagan provides an account of the history of the American administrative state as “[t]he history of competition among different entities for control of its policies.” She writes:

All three branches of government—the President, Congress, and the Judiciary—have participated in this competition, so too have the external constituencies and internal staffs of the agencies. Because of the stakes of the contest and the strength of the claims and the weapons possessed by the contestants, no single entity has emerged finally triumphant, or is ever likely to do so. But at different times, one or another has come to the fore and asserted at least a comparative primacy in setting the direction and influencing the outcome of administrative process. In this time, that institution is the Presidency.

Kagan notes that President Nixon sought to control a hostile bureaucracy “by creating a ‘counter-bureaucracy’ within the EOP, with a White House staff more than double the size of Lyndon Johnson’s, a new White House-centered Domestic Council to formulate policy positions on domestic issues, and an expansive OMB,” but that “[t]he sea change began with Ronald

234 See Kagan, supra note 6, at 2246 (providing an overview of Kagan’s article justifying President Clinton’s control of administrative policy).
235 Id.
236 Id. Kagan further notes that, “[e]ach kind of administrative control that this account highlights—congressional control (through bureaucratic experts), and interest group control—achieved its heyday at roughly the appointed time, but each also survives in some form today, well past its purported demise.” Id. at 2254.
237 Id. at 2276.
Reagan’s inauguration. In the first month of his administration, President Reagan issued Executive Order 12,291, which “effectively gave OMB a form of substantive control over rulemaking; under the order, OMB had authority to determine the adequacy of an impact analysis and to prevent publication of a proposed or final rule, even indefinitely, until the completion of the review process.” The centralization of administration continued under President George H.W. Bush and reached its zenith under President Clinton.

Kagan writes:

President Clinton treated the sphere of regulation as his own, and . . . made it his own, in a way no other modern President had done. Clinton came to view administration as perhaps the single most critical—in part because the single most available—vehicle to achieve his domestic policy goals. He accordingly developed a set of practices that enhanced his ability to influence or even dictate the content of administrative initiatives. He exercised this power with respect to . . . rulemakings, more informal means of policymaking, and even certain enforcement activities.

Indeed, Clinton went far beyond Reagan in his assertions of authority to direct administrative policy. As Kagan notes, “Presidents before Reagan . . . usually had shunned direct EOP involvement in any administrative rulemaking, and even Reagan, in creating a mechanism for this involvement, had disclaimed any authority ultimately to displace the judgment of agency officials.” Clinton, on the other hand, “implied precisely this power—presidential directive authority over discretionary decisions assigned by Congress to specified executive branch officials (other than the President).” The agencies “were his and so too were their decisions.”

Kagan acknowledges that Congress may grant discretionary authority to agency officials alone and that the President must respect the limits of such

---

238 Id. at 2277.
239 Id. at 2278. Kagan also notes that “the order and the legal opinion supporting it explicitly disclaimed any right on the part of OMB, or the President himself, to dictate or displace agency decisions.” Id. That might have been true in theory, but the power granted to OMB suggested a different reality. In addition to “the delay created by OMB review,” critics were concerned about delay as well as “the secrecy with which President Reagan’s regulatory oversight system operated.” Id. at 2280 (noting that “[m]ost of OMB’s communications with the agencies . . . never appeared in the public record”).
240 See id. at 2344 (noting that “[b]oth Reagan and Clinton used their methods of administrative control to drive a resistant bureaucracy and political system.” (emphasis added)). The “resistant” political system apparently refers to Congress. Id.

244 Id.
delegations, but she also argues that Congress seldom specifically precludes the President from directing the official to whom Congress has delegated the discretion. Thus, "most statutes granting discretion to executive branch—but not independent—agency officials should be read as leaving ultimate decisionmaking authority in the hands of the President." Kagan’s controversial interpretive principle seemingly aligns with the Supreme Court’s decision in Chevron, which endorsed the EPA’s reliance "upon the [Reagan] administration’s views of wise policy" in granting deference to the EPA’s changed interpretation of the Clean Air Act.

Kagan argues for presidential administration on two grounds: accountability and effectiveness. With respect to the first, she argues that presidential administration enhances transparency, "enabling the public to comprehend more accurately the sources and nature of bureaucratic power," and "establishes an electoral link between the public and the bureaucracy, increasing the latter’s responsiveness to the former." Presidential administration is also more effective. Being a unitary actor, the President presumably "can act without the indecision and inefficiency that so often characterize the behavior of collective entities," and "because his ‘jurisdiction’ extends throughout the administrative state (or at least, the executive branch), he can synchronize and apply general principles to agency action in a way that congressional committees, special interest groups, and bureaucratic experts cannot." For Kagan, the ultimate measure of success is effectiveness “in establishing new priorities for agencies and in advancing a broad domestic policy agenda.”

Kagan acknowledges that her conclusion “would be less sound to the extent that the political and administrative systems fail to impose adequate

---

245 Id. at 2320.
246 Id. She adds: “This rule of statutory construction appropriately derives from an effort to determine congressional intent as well as, given some uncertainty in doing so, an effort to promote good lawmaking practices.” Id. Kagan notes that when she refers to the President, she is, of course, speaking “of a more institutional actor—the President and his immediate policy advisors in OMB and the White House.” Id. at 2338. Kagan does not extend this rule to independent agencies. Id. at 2327.
248 Id. at 2331–32.
249 Id. at 2339 (footnote omitted). In this regard, Kagan relies on Alexander Hamilton’s view as to the desirability of “energy” in the executive. See id. at 2341–43 (quoting THE FEDERALIST NO. 70, at 402 (Alexander Hamilton) (Isaac Kramnick ed., 1987) (“A feeble executive implies a feeble execution of government. A feeble execution is but another phrase for bad execution; and a government ill executed. . . . must be, in practice, a bad government.”)).
250 See id. at 2345 (describing “Clinton’s brand of presidential administration” as “highly effective” in this regard).
251 Id.
limits on the President’s exercise of administrative power.” While she also acknowledges the continued importance of agency expertise, she justifies her approach by arguing that politics will not impinge on agency expertise in many cases. Because “not all agency action entails the application of expertise,” “presidential dictation of agency action” does not always displace agency action. Further, Kagan argues, Presidents will often have incentives to “encourage the application of expertise to administrative problems.” In that vein, she notes President Clinton’s inclination to “steer clear” of many environmental regulations.

These theories of executive accountability and energy emphasize the benefits of a unitary actor—the President. But the President obviously relies on others to assist him in executing the laws. He may depend on political appointees or civil servants in the various departments and agencies. Most important, he may rely on members of the EOP, who now number about 4000, and, for the most part, are not subject to Senate confirmation or readily amenable to congressional oversight. Although the President can familiarize himself personally with only a relatively small number of the issues with which the EOP deals, many staff members will purport to speak for the President when dealing with federal agencies on issues of substantial importance, and their views usually will carry the day, regardless of whether they really represent positions that the President himself has actually considered, let alone adopted.

Given the limited role that Kagan envisions for agency expertise, it is not surprising that she ultimately urges greater latitude for agencies to change discretionary policies for political reasons. Those views align well with the Trump Administration’s assertions of power to alter policies based on a “change in administrations” under Chevron and Justice Rehnquist’s partial dissent in State Farm. Such deference to political change makes sense only in light of the larger current of understanding that expertise no longer justifies broad delegations to administrative agencies. If expertise has fallen out of the larger picture of theoretical justifications for the

253 Id. at 2352 (arguing that “the apparent tradeoff between politics and expertise” is “overdrawn”).
254 Id. at 2354.
255 Id.
256 Id. at 2356.
257 See infra discussion surrounding notes 503–08 (explaining Justice Kagan’s argument that Presidents should have greater authority to influence the policies of administrative agencies).
258 See supra discussion surrounding notes 84–91 (detailing the Trump Administration’s efforts to change existing rules, such as by repealing two major environmental regulations). As previously explained, the Trump Administration’s complete refusals to consider the merits of certain issues are so extreme that they violate the unanimous holding of State Farm. See supra discussion surrounding notes 100–01 (describing a district court holding that an agency’s failure to consider the merits of a repealed rule lacked the “reasoned analysis” required by State Farm). Kagan’s argument does not question the unanimous portion of State Farm.
administrative state, it may also be unnecessary to continue insisting that agencies engage in expert analysis when changing policies.

Many contemporary regulatory problems involve complicated questions of policy and resource allocation as well as scientific or technical questions. Science may tell us within a reasonable degree of certainty about the varying degrees of risk that come with different levels of exposure to various toxic substances, and science can provide an informed judgment about what levels of risk are advisable. But science alone cannot tell us how much society should ultimately spend to lower, from one level to another, the risk of exposure to one toxic substance, as opposed to what we should spend to reduce the risk of exposure to another toxic substance, from one level to another. That, ultimately, is a normative or political question—the answer to which can be aided by science, but not dictated by science alone. Because of their expertise, agencies are well positioned to make judgments about these hybrid questions of science-policy, but we expect them to do so in a transparent way, showing candor with respect to the various elements of the problem, the processes by which their judgments were formed, and the ways in which their judgments may be limited.

Much is typically at stake, politically and economically, in technical and science-intensive rules. It is not surprising, therefore, that the President, whose perspective theoretically encompasses the fullest range of governmental issues, should wish to have a voice in the resolution of such issues. At the same time, it seems necessary that the political and scientific parts of the problem should be kept separate, and the relationship between the two should be made transparent. For example, decisions dictated by resource allocation demands or other political choices should not be passed off as having been dictated by science. But Wendy Wagner has identified “a growing body of evidence reveal[ing] that the White House may regularly (and surreptitiously) suggest change to the technical details of agency analyses.” This practice can only undermine confidence in agency expertise. The task for administrative law today is to accommodate the respective claims of agency expertise and presidential power in a manner that is transparent and also promotes rational decision making.

Past scholarship has articulated a variety of theories aimed at legitimating or de-legitimating the administrative state. Great battles have been fought over those theories, and, even now, the question remains whether any theory can satisfactorily ground administrative agencies within the context of our constitutional system. Those fires erupt from time to time, die down, and erupt again. The ultimate outcome of disputes over the

---

260 See id. (describing the “institutional fork in the road” that results from this practice).
261 Id.
262 See, e.g., Vermeule, supra note 15, at 2478 (describing different theoretical bases to legitimize the administrative state within the constitutional scheme).
legitimacy of the administrative state remains to be seen. Fortunately, the
scope of our undertaking is more limited: to explain what values should
apply to agency changes in policy. While many scholars have found fault
with expertise as a justification for delegations of power to administrative
agencies in recent decades, the Justices have largely continued to demand
that administrative change reflect expert judgment and the consideration of
relevant scientific, technological, or economic evidence. The remainder of
this Article offers a positive procedural account of the role of expertise in
administrative change. It then explains how this understanding supports
existing requirements that agencies engage in reasoned, expert analysis
before changing policies.

III. THE SCIENCE OF ADMINISTRATIVE CHANGE: A POSITIVE PROCEDURAL
ACCOUNT OF EXPERT AGENCY DECISION MAKING

A. Congress’s Delegation of Authority to Make Expert Decisions

This Article does not attempt the Herculean feat of legitimizing the
entire administrative state. Instead, this Article addresses the narrower, but
critical question of what role expertise should play when policy changes are
made. Traditional accounts align the making of agency policy changes with
currently dominant theories of political accountability and the notion of an
“energetic” executive. This Article takes a different tack, based on the
understanding that the accommodation of change is a fundamental aspect of
expert decision making. It then provides a positive procedural account of the
capacity of agencies to adjust policies in light of change. This account shows
that agencies are uniquely situated to fulfill congressional mandates that call
for expert decision making in changing circumstances.

To start with, regulatory statutes often call for expert analysis that is
capable of incorporating new scientific or technological knowledge. Statutory provisions range from explicit directives to ground decisions on
particular types of scientific data to open-ended mandates that agencies must
fulfill by using their expertise. For example, the Endangered Species Act
requires agencies to list or delist endangered and threatened species “solely
on the basis of the best scientific and commercial data available.” Likewise, the Clean Water Act requires that the EPA ensure that certain

261 Kagan, supra note 6, at 2341–43. The executive’s energy may also be exercised by political
appointees who head agencies or officers or aides within the Executive Office of the President.

262 See Doremus, supra note 16, at 405–06 (describing the “best available science mandate” of the
Endangered Species Act).

16, at 418–36 (describing potential motivations for Congress’s best available science mandate); see also
must use the “best available, peer-reviewed science and supporting studies conducted in accordance with
sound and objective scientific practices”).
power plant structures implement the "best technology available for minimizing adverse environmental impact."266 Other statutes, such as the Toxic Substances Control Act, advance more general, scientifically informed goals of regulating chemicals that “present . . . an unreasonable risk of injury to health or the environment.”267 And still other statutes such as the Federal Reserve Act identify agency goals that require the exercise of financial expertise. That is the case, for example, with respect to Congress’s direction that the Federal Reserve Board and the Federal Open Markets Committee “maintain long run growth of the monetary and credit aggregates . . . so as to promote effectively the goals of maximum employment, stable prices, and moderate long-term interest rates.”268 Even such open-ended statutes as the Federal Trade Commission Act require the agency’s application of economic expertise when deciding whether a particular business practice amounts to an “unfair method of competition.”269 Of course, agencies carrying out these various directives still have a great deal of discretion, and promulgating new regulations in the face of scientific uncertainty, industry resistance, or pressures from non-governmental organizations often proves a daunting task.270 Still, when agencies choose to expend resources on policy change under these statutes, they act pursuant to congressional mandates, which, directly or indirectly, charge agencies with incorporating expert analysis into their decision making processes.

Critically, the expert decisions called for by these statutory mandates incorporate scientific or technological understandings that are premised on the necessity and inevitability of change. As Holly Doremus has explained, even scientific conclusions with a “fairly broad consensus” at one point in time may later prove “wrong,” when “incorrect interpretations will be corrected as inconsistent data accumulates.”271 Thus, “in the long run, the scientific process produces extremely robust information about the world,” because “tentative conclusions remain open to challenge” and always

270 See Wagner (1995), supra note 25, at 1616–17 (detailing the difficulties agencies face in promulgating regulations in light of the “science charade”).
271 Doremus, supra note 16, at 411.
present “the opportunity to refine understanding.”272 On a similar note, Joel Mokyr has charted the course of technological progress by comparing it to evolution.273 He rejects a linear notion of technological progress, instead positing that technology advances by “continuous and smooth sequences” of incremental growth that are punctuated by “leaps and bounds” of new inventions that lack “clear-cut parentage” and represent a “clear break from previous techniques.”274

These theories of scientific and technological change are consistent with the dynamic that is characteristic of more discrete regulatory questions. Annual updates to FDA-approved influenza vaccinations, for example, reflect the fact that “[f]lu viruses are constantly changing.”275 Each year’s new “vaccine composition” reflects updated scientific analysis based on the receipt and “testing [of] thousands of influenza virus samples,” on the “results of surveillance, laboratory, and clinical studies,” and on the “availability” of suitable “vaccine viruses.”276 Another example, with respect to evolving technology, is the Energy Department’s updated 2015 Wind Vision Report, which was produced by an “elite team of researchers, academics, scientists, engineers, and wind industry experts,”277 who were tasked with documenting how “[c]ontinued advancements in land-based turbines and offshore wind technologies enhance wind power opportunities in every geographic region of the United States.”278 The Department indicated its intent to update the team’s findings periodically,279 and future reports will incorporate the latest technological advances in connection with the generation of wind power.280 In FCC v. Fox, Justice Scalia credited the fact that the Commission’s “stepped-up enforcement policy” against broadcasts of fleeting expletives was made possible by “technological advances.”281 New technology made “it easier for broadcasters” to censor

programming and “bleep out offending words” that “foul-mouthed glitteratae” were wont to utter.  

To be sure, the relevant technological or scientific knowledge will ultimately become fixed, at least for current regulatory purposes, by an agency’s decision to impose certain regulatory requirements at a given point in time. This fact may prevent agencies from incorporating cutting edge research that is not yet sufficiently conclusive to support a particular regulatory requirement. Still, as Holly Doremus explains, regulation, like underlying research, “is not set in stone” and is “always subject to reexamination and refinement as the information base improves.”

Agencies are therefore able to make policy based on the best available scientific or technological data today and update that policy as underlying data evolves. Certainly, Congress did not intend for agencies to promulgate regulations based on the best available evidence that was available at the time of the rulemaking and then close their eyes to subsequent scientific or technological advances. Still less did Congress intend for agencies to fix regulatory requirements based only on what Congress knew when it enacted the underlying statute. If Congress had intended to do either of those things, it could have fixed the requirements itself, and it would not have delegated to agencies the power to revisit their regulations. For example, Congress did not intend the Endangered Species Act to protect only those species that were recognized as endangered when the Act was passed in 1973. Other statutes calling for expert inquiry require the same dynamic understanding.

Admittedly, ease of change may not be the first thing that comes to mind when one thinks of administrative agencies, and the degree to which inaction has plagued some regulatory efforts is well known. The special value of agency capacity for updating expert judgments becomes obvious, however, when one considers a positive procedural account of agency capacity for implementing change relative to that of other governmental actors. As previously noted, Congress has chosen to delegate expert decisions to agencies in a wide variety of regulatory contexts. Even where Congress could theoretically muster the resources and expertise to legislate a specific legislative solution to a particular problem, it would be difficult for Congress
to update legislation quickly or frequently, particularly if Congress were required to do so with respect to every substantive area within the aegis of the administrative state.\textsuperscript{287}

The President may change policies quickly, but it is doubtful that a single executive actor could even attempt to master the sheer volume of issues that require decision in the modern administrative state. This last point may not be obvious, given President Trump’s recent attempts to curtail regulation through a series of executive orders.\textsuperscript{288} Ultimately, however, regulatory outcomes cannot be imposed by executive decree, as Congress has charged agencies, and not the President, with the responsibility for making final decisions in most regulatory programs.\textsuperscript{289} Nor may agencies implement the President’s agenda without any explanation of the facts or issues that congressional mandates have made relevant to those decisions.\textsuperscript{290} Thus, given the undeniable requirement that agencies offer some explanation for regulatory changes, the question becomes whether expert agency analysis adds value to administrative decision making. The positive procedural account of administrative change, which is discussed in Part C, below, illustrates how expert analysis can enhance regulatory decisions and serve a broader function than mere implementation of executive policy preferences. Further, the ultimate issue reflects more than a tradeoff between executive and agency decision making, because Congress could always leave specific policy decisions to courts rather than agencies.\textsuperscript{291} The following sections will compare the relative capacities of courts and agencies for updating policy in light of scientific or technological changes.

B. The Courts’ Comparative Disadvantage in Updating Expert Decisions

Congress is not required to delegate technical or scientific decisions to administrative agencies. Courts can also resolve scientific questions left

\textsuperscript{287} See supra Part II and text accompanying notes 217–22 (discussing limits of Congress’s ability to legislate with specificity).

\textsuperscript{288} In addition to orders directing rollbacks of particular regulations, the President has also mandated that agencies eliminate two existing regulations for every new regulation they promulgate. See supra text accompanying note 54.

\textsuperscript{289} Peter L. Strauss, Foreword: Overseer, or “The Decider”? The President in Administrative Law, 75 Geo. Wash. L. Rev. 696, 759–60 (2007) (“[I]n the ordinary world of domestic administration, where Congress has delegated responsibilities to a particular governmental actor it has created, that delegation is a part of the law whose faithful execution the President is to assure” by “[o]versight, and not decision . . . .”).

\textsuperscript{290} In State Farm, all nine Justices rejected NHTSA’s completely unexplained rescission of airbag requirements. See supra text accompanying notes 36–38. Nor have any scholars advocating political control challenged this aspect of State Farm’s decision. See supra notes 6–9.

\textsuperscript{291} The tradeoffs between agency and judicial decisions may soon assume greater importance than in the past, given that jurists such as Justice Gorsuch have begun to assert a greater decisional role for judges seeking to check regulatory decisions based on “policy whim.” Buzbee, supra note 10, at 1358–59.
open by Congress, and, in areas such as antitrust law, judges decide complex economic issues (or questions of social science) without affording significant deference to administrative agencies.\textsuperscript{292} Still, generalist judges lack the kind of expertise that agencies have. Although nothing prevents the President from appointing a judge with specific expertise in a particular field,\textsuperscript{293} a single expert decision maker cannot replicate the combined expertise present across all the agencies in our system,\textsuperscript{294} and such a decision maker would have only limited influence in an adjudicatory system comprised of almost a thousand federal judges in any event.\textsuperscript{295} Moreover, agency experts draw on knowledge from fields that run the gamut from economics to medicine to engineering. Judges can sometimes add to their knowledge base by hiring specialized clerks\textsuperscript{296} or relying on the expertise embodied in briefs,\textsuperscript{297} but those resources pale in comparison to an agency’s ability to hire large expert staffs or consult outside experts free from the ethical constraints imposed on judges.\textsuperscript{298}

Even if judges could muddle through technical or scientific issues and arrive at a reasonable decision, courts are also poorly positioned to update judicial decisions to reflect new learning and changed circumstances. To begin with, \textit{stare decisis} imposes a substantial impediment to change.\textsuperscript{299} At the federal level, even if an individual district judge were inclined to set aside a particular precedent, vertical \textit{stare decisis} would prevent her from disregar digning precedent established by the relevant court of appeals or the Supreme Court. Vertical \textit{stare decisis} also compels the courts of appeals to follow Supreme Court precedent.\textsuperscript{300}

\textsuperscript{293} Adrian Vermeule, \textit{Should We Have Lay Justices?}, 59 STAN. L. REV. 1569, 1570 (2007).
\textsuperscript{294} Id. at 1587.
\textsuperscript{297} But see Allison Orr Larsen, \textit{The Trouble with Amicus Facts}, 100 VA. L. REV. 1757, 1757 (2014) (explaining that factual assertions in Supreme Court amicus briefs may cause the Court to adopt “unreliable evidence”).
\textsuperscript{298} Adrian Vermeule, \textit{The Parliament of the Experts}, 58 DUKE L.J. 2231, 2239 (2009) (noting that Congress mandates expert panels for “important cases,” including the EPA’s revisions to National Ambient Air Quality Standards).
\textsuperscript{299} Kozel & Pojanowski, supra note 9, at 135–37.
Horizontal *stare decisis* makes change even more difficult. Federal appellate panels are bound to follow rulings of earlier panels, unless the en banc court overrules the panel. The Supreme Court will also follow its earlier precedent unless a majority of the Court decides that the earlier decision should be overruled. That will not happen in most cases: the small number of cases that the Court agrees to hear each year affords few opportunities to overrule even outdated precedents. In addition, some Justices may be reluctant to overrule precedents except in the clearest cases, not only because of the institutional value of stability, but also because of a fear that overruling precedent may encourage the public to give less credence to the Court’s objectivity. Finally, litigants wishing to overturn precedents cannot jump straight to the Supreme Court or even to the court of appeals. Litigants must instead be willing to endure the cost of lengthy litigation that starts with a series of unfavorable lower court decisions and may ultimately prove futile. In administrative law cases, the long march may actually begin with lengthy administrative proceedings.

Moreover, district and circuit court judges neither set their own agendas nor have much control over the legal issues they will be required to decide. As Justice Scalia noted in his dissent in *United States v. Windsor*:

> [D]eclaring the compatibility of state or federal laws with the Constitution is not only not the “primary role” of this Court, it is not a separate, free-standing role at all. We perform that role incidentally—by accident, as it were—when that is necessary to resolve the dispute before us. Then, and only then, does it become “the province and duty of the judicial department to say what the law is.”

Judges are charged with deciding only the issues that are brought to them by litigants, and they are constrained to base their decisions on the record evidence compiled by the district court or the agency whose determinations they are reviewing. While the Supreme Court (unlike the lower federal
courts) has discretion over its docket, it is similarly constrained in the sense that it must generally select cases and issues from the pool of cases and issues that have already been litigated in the lower federal courts, the federal agencies, or the state courts. These constraints limit the Court’s ability to resolve significant issues. For example, the Court has never had occasion to directly overrule Korematsu v. United States, and even last term, in Trump v. Hawaii, Chief Justice Roberts was constrained to note that Korematsu had only “been overruled in the court of history.”

Even when litigants have a substantial basis for asking the courts to alter legal rules because of changed circumstances, the judicial process is not well equipped to address evolving understandings of science and technology. Judges tend to decide issues narrowly, incrementally, and based on rules that have been applied in the past. This backward-looking framework tethers judges to past decisions with similar facts. Consider Lon Fuller’s classic description of adjudication. As Fuller observes, a judge deciding whether a horse belongs to its original owner or a party who has procured the horse by fraud will consider how other courts have addressed similar issues (perhaps ownership of a horse procured by physical theft) in the past. A judge would not apply a brand new rule to a recurring situation unless he or she were willing (and able) to overrule a precedent the judge deemed erroneous. Judicial remedies are also incremental insofar as they apply only to the parties to a particular lawsuit, operate retroactively, and produce a definitive statement of rights and duties.

These gradual, backwards-looking, and definitive features of adjudicative decisions may contribute to a stable rule of law, but they are ill-equipped to produce decisions that must accommodate scientific or technological change. By nature, such advances tend to upend past practice and may occur in fits and starts rather than incrementally. Moreover, for matters of science or technology, the impetus to capitalize on improvements resulting from change is fundamental: it is unthinkable, for example, that

---

307 The Court has original jurisdiction in a handful of cases. For a collection of original jurisdiction cases before 1959, see The Original Jurisdiction of the United States Supreme Court, 11 STAN. L. REV. 665, 701–19 (1959).
308 323 U.S. 214 (1944).
310 Fuller, supra note 306, at 374 (incremental); id. at 380 (previously applicable rules). In Youngstown Sheet & Tube Co. v. Sawyer, Justice Jackson pointed out that the “judicial practice of dealing with the largest questions” of executive power “in the most narrow way” contributed to a “poverty of really useful and unambiguous authority.” 343 U.S. 579, 634–35 (1952) (Jackson, J., concurring).

any physician would advise a cancer patient in 2019 to undergo treatment based on the best medical treatment available in 2009. Lawyers, on the other hand, typically make arguments based on longstanding precedent and past practice, while avoiding arguments that may seem overly imaginative, creative, or novel. Wishing to avoid reversal, judges likewise avoid the appearance of “[c]reativity and imagination,” which are “valued qualities” in science. 317

Lon Fuller also thought that courts could not handle polycentric problems—the sort of multidimensional and interrelated problems that are often the meat of administrative proceedings. Fuller analogized these polycentric problems to a “spider[‘s] web,” in which a “pull on one strand will distribute tensions after a complicated pattern throughout the web as a whole.” 318 In his time, Fuller thought those problems were exemplified by governmentally imposed price controls. 319 When the United States imposed certain price controls during World War II, for example, “the agencies charged with allocative tasks did not attempt to follow the forms of adjudication.” 320 This was a situation, Fuller suggested, that presented “too strong a polycentric aspect to be suitable for adjudication.” 321

Fuller based his analysis on the need for allocative determinations in problem areas that antedated the kind of technological and scientific questions that Congress has delegated to agencies in more recent decades. 322 Still, Fuller’s example of wage and price controls implicates an economic problem that is not difficult solely because it is multidimensional and interrelated or requires expert judgment. Critically, it is also difficult because it is dynamic. Indeed, with respect to wage and price controls, Fuller notes that “courts move too slowly to keep up with a rapidly changing economic scene,” and that they “cannot encompass and take into account the complex repercussions that may result from any change in prices or wages.” 323

The reasons are obvious. Dynamic circumstances present a crucial obstacle to the application of an incremental and backwards-looking adjudicative process: relevant inputs, such as the number of qualified workers and the demand for particular products, will change over time. Further, changes in underlying facts may be accompanied both by changes in economic theory on how to measure demand and by changed policy views on questions like the percentage of profits that should be allocated to workers. All of these variables make questions of wage or price control

323 Id. at 394.
unsuitable for judicial resolution. In addition, the multidimensional and interrelated nature of many polycentric problems will unfold over time, as solutions to particular problems create unintended consequences. For example, a parent who keeps his or her children inside to protect them from abduction may find that their lack of exercise and increased screen time decreases their physical fitness. A static mechanism that attempts to resolve safety issues early on cannot adjust for unintended consequences of this sort.324

Given the judicial branch’s many limitations with respect to polycentric disputes involving technical or scientific questions, it should not surprise that Congress has largely chosen to delegate questions of this sort to agencies. When there have been exceptions, most notably in the area of antitrust, courts have struggled to keep legal rules up to date. For example, most cases arising under the federal antitrust laws require courts to make economically-informed competition policy determinations when deciding claims brought by private parties, the Department of Justice, or the FTC.325 But courts have lagged behind developments in economic thought. The Supreme Court, for example, has lagged far behind the rise and fall of the Chicago School as a dominant theory for assessing competition policy. Starting in the 1960s, the Chicago School critiqued antitrust decisions for failing to recognize that markets would often self-correct or that antitrust liability would often stifle efficient business practices.326 The Supreme Court accepted some of the Chicago School’s theoretical arguments in the 1970s when it adopted a rule of reason test (and thus allowed an efficiency defense) for territorial distribution restraints in Continental T.V., Inc. v. GTE Sylvania, Inc.327 Although the available theoretical arguments also supported a relaxed rule for distributional restraints involving resale price,328 the Court did not change the rule of per se illegality for resale price maintenance for the next twenty years.

Thus, even by the late 1990s—almost twenty years after GTE Sylvania—Judge Richard A. Posner of the Seventh Circuit was still obliged

324 Doremus, supra note 16, at 412 (“Unlike research science, courtroom science is a short-term project with consequences that are understood to be both important and irreversible.”)
325 Waller, supra note 292, at 834–41. Although the FTC decides a small percentage of cases in the first instance, courts do not extend great deference to the FTC’s competition policy judgments on appeal. Id. at 34–36; see also Daniel A. Crane, Technocracy and Antitrust, 86 TEX. L. REV. 1159, 1188–89 (2008) (discussing Justice Breyer’s use of “technocratic solutions”).
328 Id. at 69–70 n.10 (White, J., concurring) (discussing argument for extending the rule of reason to resale price maintenance); see also Richard A. Posner, Antitrust Policy and the Supreme Court: An Analysis of the Restricted Distribution, Horizontal Merger and Potential Competition Decisions, 75 COLUM. L. REV. 282, 292–93 (1975) (“[R]esale price maintenance . . . is simply another method of dealing with the free-rider problem” that undermines the ability of manufacturers to ensure point of sale services at the retail level).
to follow precedent rendering maximum resale price maintenance illegal per se when he wrote the panel opinion in *Khan v. State Oil Co.* 329 While the Supreme Court later overruled the per se rule against *maximum* resale price maintenance in *State Oil Co. v. Khan*, 330 that decision did not undo controlling precedent applying a per se rule to *minimum* resale price maintenance—that only came a decade later in *Leegin Creative Leather Products v. PSKS, Inc.* 331 Thus, the lower federal courts were precluded from considering the Chicago School’s theoretical justifications for all categories of distribution restraints until thirty years after the Court’s initial acceptance of these arguments in 1977.

Ironically, by about the time that the Supreme Court incorporated Chicago School theory into its entire line of distribution restraint decisions, leading scholars had questioned the Chicago School’s theoretical assumptions as ill-conceived and badly out of date. 332 As Justice Breyer pointed out in his dissent in *Leegin*, empirical evidence showed that, contrary to the Chicago School’s predictions, there were significant retail price increases in states where federal and state law authorized resale price maintenance for a limited period of time. 333 Since *Leegin*, scholars have identified a growing body of empirical evidence associating resale price maintenance agreements with anticompetitive increases in consumer prices. 334 Moreover, while the Chicago School assumed the desirability of protecting the ability of manufacturers to guarantee in-store, point of sale services, more recent internet sellers like Amazon have wooed countless customers by forsaking these very point of sale services. The specific fact patterns before the Court in *GTE Sylvania* addressed a plausible need for point of sale services for television sets in the 1970s, and in *Leegin* the weakly plausible (at best) need for point of sale services for women’s accessories in 2007. By their nature, these decisions could not consider different types of products, such as books, for which point of sale services may be irrelevant. Nor could the final judicial pronouncements in *GTE Sylvania* and *Leegin* adjust to accommodate new market conditions or the

333 *Leegin*, 551 U.S. at 912–13 (Breyer, J., dissenting) (arguing that “most economists today agree” that “resale price maintenance tends to increase consumer prices” (citation omitted)).
334 This evidence ranges from admissions to anticompetitive use of resale price maintenance by horizontal cartel participants to market comparisons showing significant price increases in states where the rule of reason applied post-*Leegin*. See Jonathan B. Baker, *Taking the Error Out of “Error Cost” Analysis*, 80 ANTITRUST L.J. 1, 18 (2015) (“[A] recent study of a sample of convicted contemporary international cartels concludes that at least one quarter used vertical restraints to support collusion.”); *id.* at 21 (noting that, in a study done after *Leegin*, states following the rule of reason had “higher” prices and “lower” output than states that retained the per se rule as a matter of state law).
fact that point of sale services seem to be growing irrelevant for more and more categories of products, which probably now include televisions and women’s accessories.

Although antitrust scholars continue to debate rules of antitrust liability for distribution restraints, proponents of both theories should find judicial antitrust decisions ill-equipped to keep pace with advances in economic learning. From the Chicago School perspective, the Court allowed an outdated precedent to proscribe potentially efficient resale price maintenance agreements for at least thirty years. From a post-Chicago or behavioral perspective, the Court’s Leegin decision condoned at least a decade of increased consumer prices, premised on unrealistic assumptions about the desirability of point of sale services. Even astute judges can only do so much. Because courts have limited ability to update their decisions, Congress cannot expect judges to incorporate new economic learning either quickly or thoroughly when it delegates expert decisions to them.

C. The Superior Capacity of Agencies to Accommodate Change

Agencies can update policies to reflect advances in scientific learning or expertise better than courts. Courts are constrained to issue orders on a case-by-case basis, resolve only the particular disputes that litigants bring to them, and decide only the legal issues that cannot be avoided if the dispute is to be resolved. Agencies, on the other hand, are not limited to issuing adjudicatory orders. Agencies can also resolve a broad range of questions through the promulgation of binding rules and a panoply of less formal actions, including advisory opinions, guidance documents, information gathering concerning industry problems or policy issues, and the publication of studies and reports. Decisions made outside of the formal adjudication process are not limited by an official record requirement, and, in some cases, agencies may also consult expert panels when making decisions.

Rulemaking offers agencies the broadest and most stable manner of changing policy, and agencies may alter existing rules so long as they use an appropriate rulemaking procedure to do so. This procedural

335 See Sierra Club v. Costle, 657 F.2d 298, 410 (D.C. Cir. 1981) (noting that the court had “given the agency the benefit of the doubt out of deference for the terrible complexity of its job” and the task it faced in resolving expert issues fit for “engineers, computer modelers, economists or statisticians”).

338 Vermeule, supra note 298, at 2239.

339 Agencies do not need to promulgate rules before announcing a new standard in an adjudication, SEC v. Chenery Corp., 332 U.S. 194, 202 (1947), and they do not need to engage in rulemaking to change
requirement has sometimes raised concerns over ossification, that is, an institutional reluctance to alter possibly outmoded rules because of the time and effort required to promulgate new ones. \(^{340}\) Recent research suggests that ossification concerns may have been overstated,\(^{341}\) however, and ossification does not “bind” an agency in the same way that *stare decisis* binds courts in any event. Further, while expert decision making necessarily requires a slower decision making process than policy changes based on whim or political preference alone, agencies that invest the time necessary to change rules can alter policy on a broad and uniform national scale.\(^{342}\) While agency decision making may be time consuming, the months or years that an agency may invest in rulemaking will often pale in comparison to the decades it may take to litigate a complete set of issues through the judicial system to final decision by the Supreme Court.

Unlike courts, agencies can also alter standards contained in existing rules, orders, or guidance statements without waiting for private parties to initiate a proceeding.\(^{343}\) In addition, agencies may choose to update existing policies on their own initiative, based on internal agency analysis or prompts from the President or Congress.\(^{344}\) Whatever the source of the nudge, however, the ultimate decision must be taken by the agency that Congress has placed in charge of making applicable policy.

Nor do traditional rules of *stare decisis* limit agencies in reconsidering existing decisions. To understand that issue, one must appreciate two different “mode[s] of reasoning” involved in agency decisions,\(^{345}\) which Randy Kozel and Jeff Pojanowski have helpfully described as “expositive” and “prescriptive.”\(^{346}\) An agency engages in prescriptive reasoning when it “exercises its discretion to implement a legislative directive by weighing evidence, utilizing technical expertise, and making policy choices.”\(^{347}\) Expositive reasoning, on the other hand, occurs when an agency seeks to

---

\(^{340}\) See Wendy Wagner et al., *Dynamic Rulemaking*, 92 N.Y.U. L. Rev. 183, 188, 199 (2017) (discussing the process of regulation review that occurs at the agency level and noting the fact that different agencies may be subject to “different rulemaking procedures”).

\(^{341}\) *Id.* at 259.

\(^{343}\) *Id.* at 1116–17 (acknowledging the “increasing[... complex[ity]” of the legal system and “limited resources” of the Supreme Court).

\(^{344}\) 5 U.S.C. § 555(a)–(e) (2012). See also Kagan, supra note 6, at 2254 (describing how three types of administrative control “bleed” into one another).

\(^{345}\) Kozel & Pojanowski, supra note 9, at 141–46.

\(^{346}\) *Id.* at 141–42.

\(^{347}\) *Id.*
determine "what Congress actually intended with respect to a particular issue." 

Neither form of agency reasoning is subject to traditional rules of stare decisis. Courts review expositive decisions, in which agencies ascertain statutory meaning, under a variety of deference doctrines. These deference doctrines place varying degrees of weight on consistency with past interpretive decisions made by agencies and courts, but none rise to the level of uniformity required by stare decisis. On the other hand, courts address changes in prescriptive decisions under the "arbitrary and capricious" standard of review, which focuses on the agency's reasoning process and allows an agency to alter its policies so long as it adequately explains its reasons for doing so.

Unlike courts, agencies are not tied to backwards looking standards when setting regulatory policy. Instead, advances in expert or scientific knowledge have often enabled agencies to adopt new regulatory responses to recurring and evolving problems. For example, when Federal Reserve Chairman Ben Bernanke was confronted with the 2008 financial crisis, he was able to avoid the policy mistakes that are now thought to have

---

348 Id.
349 See William N. Eskridge, Jr. & Lauren E. Baer, The Continuum of Deference: Supreme Court Treatment of Agency Statutory Interpretations from Chevron to Hamdan, 96 GEO. L.J. 1083, 1099 tbl. 1 (2008) (listing various deference doctrines such as Consultative Deference, Skidmore, Beth Israel, Chevron, etc.).
350 Compare Chevron U.S.A. Inc. v. Nat. Res. Def. Council, Inc., 467 U.S. 837, 863 (1984) (holding that the fact that the EPA has "from time to time changed its interpretation" does not lead to a conclusion that "no deference should be accorded to the agency's interpretation of the statute" at issue), with Skidmore v. Swift & Co., 323 U.S. 134, 140 (1944) (holding that the validity of an agency's judgments, such as rulings, interpretations, and opinions, will "depend upon . . . [their] consistency with earlier and later pronouncements").
351 Nat'l Cable & Telecommns. Ass'n v. Brand X Internet Servs., 545 U.S. 967, 981 (2005) ("Some of the respondents dispute this conclusion, on the ground that the Commission's interpretation is inconsistent with its past practice. We reject this argument. Agency inconsistency is not a basis for declining to analyze the agency's interpretation under the Chevron framework. Unexplained inconsistency is, at most, a reason for holding an interpretation to be an arbitrary and capricious change from agency practice under the Administrative Procedure Act.").
352 See supra notes 350–51.
353 5 U.S.C. § 706 (2012); Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 34 (1983) (applying the arbitrary and capricious standard). To be sure, the line between expository and prescriptive reasoning may not always be clear: scientific questions could either be addressed directly by Congress or left to agencies with an open-ended delegation of authority. See Catherine M. Starkey, Cutting in on the Chevron Two-Step, 86 FORDHAM L. REV. 2359, 2348 (2018) (noting that while agency expertise is at the center of a court's analysis, courts will still require agencies to prove "reasoned decisionmaking" under the Chevron-State Farm model). Nevertheless, given Congress's widespread use of open-ended administrative statutes, see Christine Chabot, Selling Chevron, 67 ADMIN. L. REV. 481, 510–12 (2015), and its concomitant grant of large swaths of agency discretion on matters that turn on scientific or other forms of expertise, the principal concern of this Article is with the role of expert discretion in agency alterations of prescriptive decisions. This analysis also sets to one side the growing debate over Chevron deference in judicial review of agency decisions.
exacerbated the Great Depression. Instead, Bernanke was able to facilitate “innovations” that “resulted in large increases in the amount of Federal Reserve credit extended to the banking system.” Similarly, when laws encouraging good motoring behavior failed to stem the flood of fatalities caused by automobile accidents, NHTSA was able to implement a new approach, namely technology-forcing performance standards that required vehicle manufacturers to implement safer motor vehicle design. Although it took time to secure improvements such as seatbelts and airbags, NHTSA estimates that its vehicle safety technology requirements have saved over 500,000 lives. In other instances, scientific advances have prompted agencies to update health policies such as vaccination recommendations and dietary recommendations for pregnant women. Sometimes these advances have even required agencies to confront new regulatory problems such as the relationship between greenhouse gas emissions and climate change.

Problems involving science or other forms of expertise also tend to be polycentric and can therefore benefit from analytical procedures that break down their multifaceted and interrelated issues into manageable units of

357 Id. at 339.

359 The CDC now recommends only two HPV shots for younger adolescents. CDC Recommends Only Two HPV Shots for Younger Adolescents, CTRS. FOR DISEASE CONTROL & PREVENTION (Oct. 19, 2016), https://www.cdc.gov/media/releases/2016/p1020-HPV-shots.html (noting that the CDC previously recommended three doses to protect against cancers caused by HPV).

361 See Massachusetts v. EPA, 549 U.S. 497, 505 (2007) (“Calling global warming ‘the most pressing environmental challenge of our time,’ a group of States, local governments, and private organizations alleged in a petition for certiorari that the Environmental Protection Agency (EPA) has abdicated its responsibility under the Clean Air Act to regulate the emissions of four greenhouse gases, including carbon dioxide.”).
analysis. In many cases, for example, science may provide limited
information upon which to base a policy decision, especially at the frontiers
of knowledge.\footnote{Grobstein, supra note 283, at 126 (noting that science is “rarely decisive in policy making,” and that research at the forefront of knowledge presents uncertain “concepts still being evaluated and possibly yet to be modified”).} Oliver Williamson, the 2009 Nobel Laureate in Economic
Sciences,\footnote{Oliver E. Williamson – Facts, NOBELPRIZE.ORG, https://www.nobelprize.org/prizes/economic-sciences/2009/williamson/facts/ (last visited Sept. 11, 2019).} has proposed a helpful “decision process approach” that
regulators may apply in cases of scientific uncertainty.\footnote{Oliver Williamson, Saccharin: An Economist’s View, in THE SCIENTIFIC BASIS OF HEALTH AND SAFETY REGULATION 131, 142 (Robert W. Crandall & Lester B. Lave eds., 1981).} Williamson’s
approach makes use of a decision tree to order and identify discrete choices
and break down the costs and benefits relevant to each choice.\footnote{Id. at 145.} As
explained below, this approach plays to the strengths of the regulatory
process. It is quite different from the procedure that leads courts to develop
a binary and permanent decision based on arguments made by a limited
group of parties.

To illustrate Williamson’s proposal, consider a regulatory scheme that
focuses on the elimination of health hazards associated with food additives.
Sometimes, for example, a food dye that might pose a serious but
unquantified health risk will have a close substitute that does not pose the
same risk. In this case, it is not necessary to confront uncertainty over the
precise level of risk presented by the initial dye, because the regulator can
simply steer consumers toward the dye that does not present the risk.\footnote{Id. at 147–48.} If
there is not a ready substitute, however, a regulator should further calibrate
different costs of limiting consumer access to a potentially risky product.
For example, would removal of the dye eliminate countervailing health
benefits for some users or cut off significant economic benefits to the
manufacturer of the product?\footnote{See id. at 145.} Williamson also notes that risks posed by a
weak carcinogen like saccharin may be outweighed by weight control
benefits,\footnote{Id. at 148.} and that even potent carcinogens like the aflatoxins found in
peanut butter may be necessary to offer an “inexpensive form of protein.”\footnote{Id. at 149.}

It may also be the case that health risks associated with certain products
are borne only by particular users, or that the costs of certain regulations are
borne disproportionately by particular industries.\footnote{Williamson, supra note 364, at 145.} With respect to the
former problem, a regulator may be able to craft a limited regulatory solution
aimed at protecting a particular group of users. Thus, a warning that pregnant
women should not consume alcoholic beverages might provide a better
solution than an absolute ban on the sale of alcoholic beverages. Regulators might also be expected to refrain from promulgating general rules that do not adequately address disproportionate effects on a single industry.\textsuperscript{371}

In addition, Williamson’s recommendation that agencies break down decisions into discrete sub-issues could provide a helpful framework for agencies to address the problem of change as scientific or technological knowledge grows. Thus, a complete ban on dye supported by research establishing some level of health risk might be ripe for revision if new research clarified that health risks existed only for children under a certain age or that new manufacturing processes could cheaply remove the ingredient associated with health risks. This capacity for change allows an agency to regulate with confidence in the present despite the necessarily uncertain state of scientific knowledge. Williamson’s approach allows the agency to acknowledge the provisional nature of its initial findings and gives it the flexibility to adjust policies as scientific knowledge progresses.

To the extent that an agency is willing to make its particular regulatory priorities transparent, Williamson’s analytical framework will also enhance political accountability. An agency might identify the current state of scientific knowledge, the scope of uncertainty surrounding that knowledge, and the policy priorities it will apply in the face of uncertainty.\textsuperscript{372} This granular analysis could clarify, for example, whether a particular administration prioritizes eliminating cost to industry or protecting children or perhaps even less quantifiable concerns such as human dignity. These factors may gain importance where scientific knowledge remains uncertain. Conversely, as scientific knowledge becomes more certain, agencies should have less room to prioritize discretionary factors or to adopt a policy contrary to scientific evidence.\textsuperscript{373}

Williamson’s framework appropriately recognizes that many scientific and technical problems are complex and unlikely to present a single objective answer to important policy problems. To be sure, Williamson seems to call for a level of analytical transparency that may be difficult to obtain.\textsuperscript{374} Nevertheless, the tradeoffs acknowledged by Williamson’s procedural framework are well within the ken of regulators. Williamson’s

\textsuperscript{371} United States v. Nova Scotia Food Prods. Corp., 568 F.2d 240, 253 (2d Cir. 1977) (invalidating the general rule which failed to address the possibility that its standards would render canned whitefish unmarketable).

\textsuperscript{372} Williamson notes, for example, that non-health benefits or efficiency benefits can also be considered in the decision making framework. Williamson, supra note 364, at 145.

\textsuperscript{373} In State Farm, it was “surely . . . not enough” for NHTSA to ignore evidence on safety benefits of airbags on the ground “that the regulated industry . . . eschewed” airbags. Motor Vehicles Mfrs. Ass’n of the U.S. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 48–49 (1983).

\textsuperscript{374} See Wagner (1995), supra note 25, at 1677 (“Since the task of determining levels of toxins that are ‘safe’ is misidentified as one that must be answered by science, and is typically in the first instance assigned to agency scientists, it is not surprising that few answers come forward.”).
framework also plays to the particular procedural strengths of agencies. They can regulate around uncertain levels of risk, incorporate political factors, and adjust their policies as scientific knowledge evolves. Courts, on the other hand, do not generally issue provisional decisions that acknowledge uncertainty. They also avoid overt reference to political factors and do not generally consider the interests of non-parties who may be affected by their rulings.

One of us has previously written about cases arising out of the AIDS epidemic as an illustration of the problems that courts face when they decide cases “at the frontiers of scientific knowledge.” In the early 1990s, courts were required to decide whether persons with HIV posed a “significant risk” of transmitting HIV to others in work, school, or healthcare environments. Rather than refining the “significant risk” test “through common law development,” later courts essentially “redefin[ed] . . . the test” as one that would be satisfied by “the existence of any risk rather than the existence of a significant risk.” While this test was easier for courts to apply, it failed to protect persons with HIV from unwarranted discrimination.

That article attributed the courts’ failures to the difficulties of using adjudication to solve a polycentric problem. Although courts approached the issue of “significant risk” as “raising only factual issues,” assessment of risk ultimately implicated normative concerns as well as scientific knowledge, which was initially limited and “provisional.” From the vantage point of 2018, it seems that the potentially provisional nature of scientific knowledge may have posed overwhelming challenges for these courts. The possibility that scientific knowledge would change may have driven courts to adopt an overly precautionary standard in the 1990s. If subsequent studies identified higher or different transmission risks of HIV

375 See Leegin Creative Leather Prods., Inc. v. PSKS, Inc., 551 U.S. 877, 900 (2007) (concluding that “[s]tare decisis . . . does not compel . . . continued adherence to the per se rule against vertical price restraints”).
376 “It is said that ‘[m]ost judges would sooner admit to grand larceny than confess a political interest or motivation.’” Frank B. Cross, Political Science and the New Legal Realism: A Case of Unfortunate Interdisciplinary Ignorance, 92 NW. U. L. REV. 251, 262 (1997) (alteration in original) (quoting ROBERT A. CARP & RONALD STIDHAM, THE JUDICIAL PROCESS IN AMERICA 301 (3d ed. 1996)).

which was at the time a life-threatening virus), the risk assessment in initial cases would not have left an appropriate balance in place.

The article also argued that handing off part of the decision to an administrative agency could improve risk analysis. Although courts would still be required to ensure that persons with HIV were protected from discrimination, agencies could assist courts in the underlying determination of whether there was a “significant risk” of transmission. An expert agency would be better positioned to apply Williamson’s decision making framework and consider substitute measures (perhaps precautionary measures instead of an outright ban on clinical work by dental students with HIV, for example) and indirect consequences (including the overall impact on the supply of dentists).

Of course, merely involving an agency capable of evaluating relevant costs and benefits provides no guarantee of success, and that was especially true in the politically and emotionally charged climate that characterized the early years of the AIDS epidemic. Indeed, the article recounts that early attempts by the Centers for Disease Control (CDC) to address the risks of HIV transmission from and to health care workers ultimately failed, and difficult decisions were simply passed on to the health care industry. This may illustrate that there are no perfect solutions to the most difficult problems. The CDC, however, was ultimately able to update its policies to better reflect scientific knowledge.

As these examples suggest, agencies apply technical and scientific knowledge to a variety of difficult issues. The difficulty of the questions that agencies confront, together with the often-uncertain state of relevant knowledge, means that many questions will not yield indisputably clear answers. Indeed, as underlying science or technical knowledge changes, the best answer today may well become suboptimal, dated, or patently wrong tomorrow. Agencies are uniquely situated to adjust policies and replace inferior, dated, or incorrect conclusions with findings that better reflect the state of underlying knowledge.

To be sure, the benefits of an agency’s ability to change policies are not limited to scientific or technical decisions within an agency’s area of expertise. One might also favor the ability of an agency to effectuate change

---

386 See id. at 689–90 (advocating a procedure whereby courts take guidance from agencies without “abdicating their responsibilities to administration”).
387 Id. at 665.

389 Id.
390 See Ctrs. for Disease Control & Prevention, HIV Transmission, U.S. DEP’T HEALTH & HUM. SERVS., https://www.cdc.gov/hiv/basics/transmission.html (last updated July 22, 2019) (clarifying that HIV is not spread by air, water, saliva, sweat, or tears and that even for health care workers, the “main risk of HIV transmission . . . from being stuck with an HIV-contaminated needle . . . is less than 1%”).
from the viewpoint of transparency and political accountability. The important point here, however, is that the ability to change favors both the expertise and political rationales for administrative agencies. Insofar as Congress has required agencies to base decisions on an expert analysis of scientific or technical evidence, one cannot simply eliminate agency expertise and allow agencies to regulate based on political considerations alone. The unique ability of agencies to effectuate change makes them specially positioned to improve policies by accommodating advances in science or technology. Thus, a rule requiring agencies to exercise expert discretion when changing policies helps advance this goal. On the other hand, a rule allowing agencies to substitute raw political preferences for expert discretion eliminates a significant advantage that agencies can provide in the policymaking arena and discounts the value that expert analysis may provide in the realm of policy change.

IV. THE SUPREME COURT HAS STRUGGLED TO STRIKE AN APPROPRIATE BALANCE BETWEEN AGENCY EXPERTISE AND POLITICAL WILL

Courts have struggled for decades to strike an appropriate balance between agency expertise and political will. Under section 706 of the Administrative Procedure Act, courts review agency policy decisions, including changes in policy, under the arbitrary and capricious standard of review. Although section 706 itself does not specifically mention agency expertise, it requires reviewing courts to “set aside” agency action found to be “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law.” Section 706 also directs courts to make this determination based on a review of “the whole record or those parts of it cited by a party.” In its 1971 decision in Citizens to Protect Overton Park v. Volpe, the Supreme Court emphasized the importance of an agency’s decisional record to a reviewing court’s ability to ensure that the agency actually considered “the relevant factors” that Congress identified.

The Court’s application of the arbitrary and capricious standard of review has long assumed a baseline of deference to agency exercise of expert discretion in cases where the agency’s reasoned analysis reveals that such discretion has been exercised. In Baltimore Gas & Electric Co. v. Natural

393 Id.
394 Id.
396 Id. at 416.
Resources Defense Council, Inc., deferred to necessarily predictive scientific determinations underlying a Nuclear Regulatory Commission rulemaking. The Court noted that the Commission’s predictions regarding the environmental impact of nuclear waste were “within its area of special expertise, at the frontiers of science.” According to the Court, “this kind of scientific determination” generally requires a reviewing court to be at its “most deferential.”

A. State Farm: Politics Versus Expertise

In State Farm, the Reagan Administration asked the Court to extend Baltimore Gas’s paradigm of strong deference to cases in which agencies substitute political concerns for expert analysis. The Court refused to capitulate to the Reagan Administration’s swift regulatory rollbacks and instead adopted the “hard look” standard of arbitrary and capricious review. All nine Justices invalidated NHTSA’s decision to eliminate existing automobile safety requirements without any explanation whatsoever. The Court split in a five-to-four vote, however, on NHTSA’s cursory rejection of data that associated safety benefits with alternative automobile safety requirements. The majority held that NHTSA’s rejection was too superficial to constitute “the product of reasoned decisionmaking,” whereas the dissent deemed NHTSA’s analysis sufficient in light of political concerns raised by a “change in administration.”

The history leading up to the State Farm decision illustrates the daunting nature of NHTSA’s regulatory mandate. In 1966, Congress began using an epidemiological approach that supported its decision to make the interiors of cars safer for occupants during inevitable automobile accidents. To that end, it delegated to the Secretary of Transportation and NHTSA broad
discretion to adopt automobile safety standards that “shall be practicable, shall meet the need for motor vehicle safety, and shall be stated in objective terms.” The adoption of appropriate safety standards called for “considerable expertise” and required the Agency to force the creation of new “technology for building safer cars.” NHTSA initially required manufacturers to incorporate manual seatbelts, but that failed to produce the desired safety benefits because few motorists chose to buckle up. From the late 1960s into the early 1970s, NHTSA undertook additional efforts to require passive occupant restraints. These efforts spanned several administrations and were met with great resistance: the automobile industry railed against these innovations based on costs and practicability, and the public also resisted change. A particularly unpopular interim effort to force seatbelt usage through ignition interlock technology engendered extreme public opposition and was overruled by Congress.

By the time of the Carter Administration, however, evidence showed that passive restraints were technologically and economically feasible, that they would save over 9000 lives annually, and that they would prevent tens of thousands of injuries. As a result, NHTSA promulgated a new rule, Modified Standard 208, which required car manufacturers to phase in passive restraint protections by the early to mid-1980s. Modified Standard 208 operated as a safety performance standard and allowed manufacturers to achieve the required safety benefits by choosing between airbags and automatic seatbelts.

The political landscape changed with the 1980 election. Drew Lewis, President Reagan’s new Secretary of Transportation, directed NHTSA to open a new rulemaking docket to reconsider Modified Standard 208. Lewis cited “changed economic circumstances” and the “difficulties of the automobile industry” as reasons for reconsideration. NHTSA ultimately rescinded Modified Standard 208 on the ground that recent manufacturer initiatives precluded passive restraints from achieving the “significant safety benefits” required.

418 Id. at 38.
benefits” that had been predicted earlier.\textsuperscript{419} NHTSA gave two primary reasons for discounting the benefits of this regulation. First, because ninety-nine percent of manufacturers opted to install automatic seatbelts rather than airbags, the “life-saving potential of airbags would not be realized.”\textsuperscript{420} Second, because most manufacturers had opted for automatic seatbelts that could be detached, the Agency expressed substantial doubt that this passive restraint technology would significantly enhance seatbelt usage and therefore safety benefits.\textsuperscript{421}

On review, the District of Columbia Circuit found NHTSA’s rescission arbitrary and capricious under section 706 of the APA,\textsuperscript{422} and the Supreme Court affirmed.\textsuperscript{423} All nine Justices rejected an extreme version of political deference and agreed that NHTSA’s rescission of airbag and non-detachable automatic seatbelt requirements was arbitrary and capricious.\textsuperscript{424} In their view, NHTSA failed to show that it exercised expert discretion because it gave no explanation for these rescissions, even though both technologies had previously been found to enhance safety and supported a final rule mandating passive restraint technology.\textsuperscript{425} According to Justice White’s majority opinion, “[n]ot one sentence” of NHTSA’s “rulemaking statement discusses the airbags-only option,” and it was “surely . . . not enough that the regulated industry . . . eschewed” this safety device.\textsuperscript{426} Further, the Agency also failed to consider the alternative of non-detachable automatic seatbelts with continuous spooling technology “in its own right.”\textsuperscript{427}

The Supreme Court premised its analysis on the understanding that “[e]xpert discretion is the lifeblood of the administrative process.”\textsuperscript{428} Thus, rescission of an existing rule requires the same “reasoned analysis for the change” that applies when an agency promulgates a new rule.\textsuperscript{429} Further, while a court may not “substitute its judgment for that of the agency,” a court must carefully consider whether the agency has “examin[ed] the relevant data and articulat[ed] a satisfactory explanation” that connects the policy

choices made to the facts found, therefore demonstrating the exercise of expert discretion.\footnote{Id. at 43. Deference will not shelter agencies that fail to exercise expert discretion in the first instance. Id. at 50 (citing SEC v. Chenery Corp., 332 U.S. 194, 196 (1947) and noting that courts will not accept “appellate counsel’s post hoc rationalizations” for an agency decision).} The Court’s “hard look” standard thus imposes “strict and demanding” requirements that the agency “cogently explain why it has exercised its discretion in a given manner.”\footnote{Id. at 48 (quoting Burlington Truck Lines, 371 U.S. at 167) (noting that, without these explanatory requirements, “expertise, the strength of modern government, can become a monster which rules with no practical limits on its discretion” (internal citation omitted)).}

The Court’s examples of arbitrary decision making underscore its insistence upon the hallmarks of expert discretion: decisions must be thoroughly reasoned and account for relevant evidence. Thus, in addition to addressing “factors” “not intended” by Congress, an agency could flunk arbitrary and capricious review if it (1) “entirely failed to consider an important aspect of the problem”; (2) explained its decision on grounds “counter to the evidence before the agency”; or (3) made an “implausible” choice that “could not be ascribed to a difference in view or the product of agency expertise.”\footnote{Id. at 43.} If the decision were purely political, as the dissenters suggested, it is not clear these last three criteria should matter. As long as the agency stays “within the bounds established by Congress,”\footnote{Id. at 53 (majority opinion).} a court could instead defer to the administration’s new policy choice as one of the spoils of the election. If the public is dissatisfied with the administration’s policies, its remedy rests at the ballot box.

In \textit{State Farm}, the Justices disagreed on how much expert analysis an agency must supply in the face of political change, and only five Justices voted to invalidate NHTSA’s elimination of automatic detachable seatbelt requirements. When the Agency eliminated these requirements, it offered a cursory explanation that re-weighed earlier evidence on predicted levels of seatbelt usage. NHTSA doubted that automatic detachable seatbelts would result in increased usage, as the predicted increase was based on field studies considering cars with automatic \textit{non-detachable} seatbelts and ignition interlock systems.\footnote{State Farm, 463 U.S. at 59 (Rehnquist, J., concurring in part and dissenting in part).} However, the Agency did not address the likelihood that inertia would cause drivers to leave seatbelts engaged. That was important because inertia was thought to be a primary reason that motorists did not buckle up to begin with.

Writing for the majority, Justice White rejected the Agency’s decision as arbitrary and capricious. The Court started from the premises that “the
The safety benefits of wearing seatbelts are not in doubt" and that Congress intended safety to be the “pre-eminent factor” in regulatory decisions made under the Motor Vehicle Safety Act. The Court recognized that NHTSA had some leeway to act without “direct evidence in support” of its position that detachable automatic seatbelts would not lead to a “substantial increase” in seatbelt usage. It also held that it was “within the agency’s discretion” to dispute the “generalizability” of studies that supported the earlier findings of increased seatbelt usage. Ultimately, however, the majority believed that the Agency had failed to offer sufficient explanation for its belief that detachable automatic belts would not yield a substantial increase in seatbelt usage. Indeed, evidence from field studies supported the Agency’s earlier finding that automatic seatbelts would increase safety as well as the policy choice based on it.

NHTSA also failed to “bring its expertise to bear” on an important aspect of the problem when it failed to discuss why inertia—a key factor limiting manual seatbelt usage—would not also bolster usage rates for detachable automatic seatbelts. Automatic seatbelts, after all, remain in use unless the occupant overcomes inertia and takes positive action to disconnect them. In addition to the omissions that the Court noted, the Agency’s initial analysis identifying safety benefits and increased usage under Modified Standard 208 already was predicated on an assumption that thirty to forty percent of automatic seatbelts would be disabled. The new rescission order confessed to a “lack of directly relevant data” to substantiate the Agency’s hunch that drivers would disable detachable seatbelts often enough to undermine their safety benefits.

Justice Rehnquist dissented on this issue; he would have upheld NHTSA’s decision to eliminate passive detachable seatbelts. He found it “reasonable” for the Agency to discount safety benefits premised on an earlier study that may have incorporated unrealistic assumptions inapplicable to many drivers. Thus, the Agency’s “explanation” of

443 State Farm, 463 U.S. at 57–58.
444 Id. at 58. Consumer choice and ignition interlock technology may have made usage rates in the study higher than in the real world.
“substantial uncertainty” as to the benefits of detachable seatbelts was “adequate” to support the Agency’s decision. Further, and most important, Justice Rehnquist emphasized that a “change in administration . . . is a perfectly reasonable basis for an executive agency’s reappraisal of the costs and benefits” of existing regulations. According to Justice Rehnquist, a new administration is entitled to assert its distinct, (de)regulatory “philosophy,” so long as its decisions stay “within the bounds established by Congress” and rationally “assess administrative records.”

Thus, none of the Justices found that political change would provide a complete justification for NHSTA to eliminate passive restraint requirements altogether. A change in administration did not license the Agency to utterly disregard evidence that airbags or non-detachable automatic seatbelts enhanced safety. Justice Rehnquist and three other Justices found political change sufficient only when the Agency exercised some discretion by re-weighing record evidence on automatic seatbelts in light of the new administration’s deregulatory philosophy. A majority of the Court found that deregulation was not supported by a sufficient analysis of the existing administrative record.

B. Recent Cases Fail to Resolve the State Farm Division

Subsequent Supreme Court decisions applying arbitrary and capricious review have failed to command a stable majority on the issues that divided the Court in State Farm. The Court has failed to resolve the tension between Justice White’s insistence on decisions supported by an adequate record of expert analysis and evidence and Justice Rehnquist’s emphasis on deference to a new President. Moreover, the recent retirement of Justice Kennedy, who provided the deciding vote in the most highly contested cases, adds to the general uncertainty about the Court’s future direction in this area.

448 The Court addressed State Farm in passing when it addressed changed policies in Smiley v. Citibank (S.D.), 517 U.S. 735 (1996), and National Cable & Telecommunications Ass’n v. Brand X Internet Services, 545 U.S. 967 (2005). In Smiley, the Court distinguished the Comptroller’s new rule defining “interest” from the “sudden and unexplained” policy change invalidated in State Farm. Smiley, 517 U.S. at 742. In Brand X, the Court reaffirmed that changes in statutory interpretation qualify for Chevron deference and cited Justice Rehnquist’s State Farm dissent for the proposition that a “change in administrations” may prompt such a change. Brand X, 545 U.S. at 981; see also FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 189 (2000) (Breyer, J., dissenting) (citing Justice Rehnquist’s State Farm dissent to support the FDA’s assertion of jurisdiction over tobacco products based on a change in administration and more expansive interpretation of the governing statute). For a helpful discussion on the application of State Farm, see Jeffrey S. Lubbers, A Guide to Federal Agency Rulemaking 509–13 (6th ed. 2018).
Signs of continued disagreement have been obvious in cases such as the Court’s 2007 decision in *Massachusetts v. EPA*.449 Although that case, which was decided by a five-to-four vote, involved the EPA’s failure to initiate a rulemaking, rather than an actual change in policy,450 the question of deference to a politically-based decision not to regulate or exercise expert discretion loomed large. In an opinion by Justice Stevens, the majority held that the EPA was required to exercise expert judgment and decide whether “greenhouse gas emissions from new motor vehicles” would cause or contribute to the harm associated with climate change, and that its failure to do so was arbitrary and capricious.451 Justice Kennedy joined Justices Stevens, Breyer, Souter, and Ginsburg in the majority.452 Jody Freeman and Adrian Vermeule have noted that *Massachusetts v. EPA* may amount to *State Farm* for a new generation, as it facilitates judicial review and forces agencies to exercise expertise when making another type of deregulatory decision that “allegedly injected politics into an expert judgment.”453

Justice Kennedy switched sides in the Court’s next significant opportunity to clarify *State Farm*. In its 2009 decision in *FCC v. Fox Television Stations, Inc.*, the Court reviewed the FCC’s decision to extend existing prohibitions of “indecent speech” to ban broadcasts of “fleeting expletives.”454 The case involved a factual and regulatory setting dramatically different from that of *State Farm*, as the Commission had crafted its indecent speech policy around First Amendment concerns and the Court’s earlier decision in *FCC v. Pacifica Foundation*.455 In *Fox*, the Second Circuit had found the Commission’s new indecent speech policy arbitrary and capricious.456 One of the court of appeals’s primary critiques focused on the absence of evidence to support the new, higher enforcement standard.457 According to the court of appeals, the Commission lacked “evidence that . . . a fleeting expletive is harmful.”458 The court of appeals also cited this lack of evidence as the reason it “found unconvincing” the Commission’s prediction that a fleeting expletive exemption “would lead to increased use of expletives.”459

456  E.g. *Fox*, 556 U.S. at 518–19 (discussing the Second Circuit’s ruling).
457  One of its grounds focused on inconsistency inherent in the Commission’s indecency policy: the Commission failed to impose a categorical ban on all broadcasts of expletives and excepted broadcasts of films such as *Saving Private Ryan*. E.g. id. at 520 (discussing the Second Circuit’s ruling).
458  Id. at 519 (quoting Fox Television Stations, Inc. v. FCC, 489 F.3d 444, 461 (2d Cir. 2007)).
459  Id. at 521.
When the case reached the Supreme Court, the Justices struggled to find common ground, writing six different opinions. Four Justices, including Justice Kennedy, aligned themselves with Justice Scalia in holding that the Commission’s change in policy was not arbitrary and capricious or governed by State Farm. Justice Kennedy wrote separately, however, to emphasize that he would continue to follow State Farm’s arbitrary and capricious standard in cases (unlike Fox) that involved scientific or technical expertise. Justice Breyer, joined by three other Justices, dissented on the ground that the Commission’s action was arbitrary and capricious under State Farm.

In his opinion for the majority, Justice Scalia first rejected the argument that the arbitrary and capricious standard imposes a heightened standard of review for cases in which an agency has changed policy. Instead, the agency must only “display awareness” of its change and “show that there are good reasons for the new policy.” While the Court did not require that reasons for the new policy be “better than the reasons for the old [policy],” it distinguished the FCC’s indecent speech policy from policy changes that implicate reliance interests or are based on “factual findings that contradict those which underlay its prior policy.” The Court went on to explain that the harm at issue in Fox could not be proved or disproved by “empirical evidence” because “[o]ne cannot demand a multiyear controlled study, in which some children are intentionally exposed to indecent broadcasts . . . and others are shielded from all indecency.”

The Court majority cited the fact that the subject of the regulation was not susceptible to objective verification as a key consideration in its

---

460 Justice Scalia wrote a majority opinion joined by Chief Justice Roberts, Justice Thomas, and Justice Alito, and joined in part by Justice Kennedy. Id. at 504. Justice Thomas concurred separately, writing that he agreed with the majority’s administrative law analysis and holding; he also raised First Amendment concerns relevant to the proceedings on remand. Id. at 530 (Thomas, J., concurring). In his concurrence, Justice Kennedy agreed with the majority’s holding and with its opinion in part, but he also agreed with part of the reasoning offered in Justice Breyer’s dissent. Id. at 535 (Kennedy, J., concurring in part and concurring in the judgment). Justices Ginsburg, Souter, and Stevens also joined the administrative law analysis in Justice Breyer’s dissent. Id. at 546–47 (Breyer, J., dissenting). Justice Ginsburg wrote separately to emphasize First Amendment concerns. Id. at 545 (Ginsburg, J., dissenting). Justice Stevens wrote separately to emphasize concerns based both on administrative law and on the First Amendment. Id. at 539 (Stevens, J., dissenting).

465 Id.

466 Id.

467 Id. at 519. The Court also found that that new bleeping technology would help networks censor fleeting expletives broadcast on live shows. Id. at 518.
On the other hand, the dissenting Justices rejected the majority’s view that the Commission’s decision was not amenable to proof, arguing that the Commission could have addressed some evidence of harm to children and, most important, that the majority’s analysis could allow agencies to “change major policies on the basis of nothing more than political considerations or even personal whim.”

Justice Scalia’s opinion studiously avoided any reference to Justice Rehnquist’s partial dissent in State Farm, and he did not address political considerations except in the part of his opinion that responded to the dissents of Justices Breyer and Stevens. As previously noted, Justice Kennedy declined to join in this part of Justice Scalia’s opinion, which therefore commanded the votes of only four Justices. Justice Scalia’s plurality opinion rejected calls for heightened scrutiny because the Commission’s policy change “was spurred by significant political pressure from Congress.” And because the Commission is an independent agency, its politically motivated policy decision did not reflect the presidential control involved in State Farm.

Justice Kennedy agreed that the Commission’s change in policy was not arbitrary and capricious, but he wrote separately to emphasize “background principles,” and to express his concern with respect to policy changes in areas of scientific or technical expertise. According to Justice Kennedy, a “more reasoned explanation” may be appropriate when “discoveries in science” or technological advances alter reasons for a longstanding policy. In these instances, “a substantial body of data and experience can shape and form the new rule,” and the agency’s decision must be “explained in light of available data” and be “informed by the agency’s experience and expertise.”

Justice Kennedy described the agency’s obligation in apolitical terms, and explained that the APA imposes on agencies a “duty . . . to find and formulate policies that can be justified by neutral principles and a reasoned explanation.” This standard precludes an agency from “simply disregard[ing] contrary or inconvenient factual determinations that it made in the past.” Justice Kennedy thus indicated that he would follow State

Farm in cases where the agency’s initial policy was supported by factual findings, but Fox did not raise the same concerns because the Commission based its prior “policy on [the Supreme Court’s opinion in] . . . FCC v. Pacifica Foundation” rather than on “factual findings.”

In sum, Fox seems to raise more questions than it answers about the proper standard of review for an agency’s change in policy. The Justices not only disagreed on the lawfulness of the FCC’s change in policy, but they also disagreed on how broadly State Farm’s test should apply. The reasoned awareness standard from Justice Scalia’s majority opinion might be read to align with Justice Rehnquist’s opinion in State Farm, but only three Justices joined the part of Justice Scalia’s opinion that supported a policy outcome that seemed to reflect congressional pressure. Justices Kennedy, Breyer, Stevens, Souter, and Ginsburg expressed reservations about this diluted standard and about the propriety of change grounded in political considerations alone. These Justices noted that they would adhere to State Farm, at least when the agency changed fact-based policies or where technical or scientific expertise is relevant.

The Court’s most recent decision, Department of Commerce v. New York, reveals the Justices’ continued disagreement over the arbitrary and capricious standard of review. As noted above, the Secretary of Commerce’s controversial decision to add a citizenship question drew shifting coalitions of five Justices, with Chief Justice Roberts providing the deciding vote on both issues. The four “more conservative” Justices joined the Chief Justice’s opinion on the initial determination that the Secretary’s action was not arbitrary and capricious because it was “supported by the evidence before him.” On a second inquiry into the adequacy of the Secretary’s explanation for his decision, however, the four “more liberal” Justices joined the Chief Justice in holding that the Secretary acted arbitrarily and capriciously because his stated rationale was “pretextual.” The Court

479 Ronald Levin asserts that the difference between the dissent and majority approaches is the dissent’s requirement that the “agency” must “make a direct comparison between” the old and new policies. Ronald M. Levin, Hard Look Review, Policy Change, and Fox Television, 65 U. MIAMI L. REV. 555, 568 (2011). The difference seems to turn on the degree of comparison required: all of the Justices in State Farm agreed that NHTSA was required to consider old policies requiring airbags alongside its new policy of no passive restraints, and Justice Scalia’s opinion in Fox requires the agency to establish that it “believes” the new policy to be better (even if a reviewing court does not agree with the agency’s reasons for this belief).
480 Fox, 556 U.S. at 518-19.
481 The Court’s 2016 decision on agency change, Encino Motorcars, LLC v. Navarro, 136 S. Ct. 2117 (2016), turns on a changed legal interpretation and provides little guidance as to how the Court would address policy change in a regulatory context involving technical or scientific agency expertise.
483 Id. at 2573.
affirmed the district court’s remand to the Agency based on its finding of pretext.\textsuperscript{584} Chief Justice Roberts’s initial assessment of evidentiary support for the Secretary’s decision implicitly favored Justice Rehnquist’s more deferential approach in \textit{State Farm}. Although the Chief Justice did not mention Justice Rehnquist’s partial dissent, he evaluated the decision of a \textit{political appointee} with the same deference due to a predictive scientific determination: Secretary Ross’s explanation needed only to lie “within the bounds of reasoned decisionmaking” under \textit{Baltimore Gas}.\textsuperscript{585} Under this deferential version of arbitrary and capricious review, it was “reasonable” for the Secretary to conclude “that reinstating a citizenship question was worth the risk of a potentially lower response rate,” particularly in light of the long history of the citizenship question being posed on earlier versions of the census.\textsuperscript{586} Chief Justice Roberts dismissed the dissent’s more searching review as an intrusive decision that effectively subordinated “the Secretary’s policymaking discretion to the Bureau’s technocratic expertise.”\textsuperscript{587} Instead, the majority held that the Secretary was entitled to discount the Bureau’s expert predictions of lowered response rates as “inconclusive.”\textsuperscript{588} Still, the majority failed to address the Secretary’s refusal to supplement the Bureau’s analysis and gather additional empirical evidence through routine testing. Nor did the majority on that issue address Justice Scalia’s earlier suggestion, in \textit{FCC v. Fox}, that “failure to adduce empirical data that can readily be obtained” might render a policy change arbitrary and capricious.\textsuperscript{589}

The dissent’s contrary view relied heavily on the majority opinion from \textit{State Farm}. As Justice Breyer noted in an opinion joined by Justices Kagan, Ginsburg, and Sotomayor, \textit{State Farm} set important limits on an agency’s ability to “exercise its judgment in moving from the facts and probabilities on the record to a policy conclusion.”\textsuperscript{590} An agency cannot “merely recite the terms ‘substantial uncertainty’ as a justification for its actions,”\textsuperscript{591} and it typically must explain a decision to take action without “engaging in a search for further evidence.”\textsuperscript{592} The Secretary’s explanation failed to satisfy these requirements. Not only did his decision contradict evidence showing

\end{itemize}
that the citizenship question would likely reduce the accuracy of citizenship data, but it avoided routine tests designed to gather and provide additional evidence on the question’s likely effect. Reliance on the citizenship question’s historical pedigree failed to address more recent evidence based on the use of a citizenship question in a survey provided to a small sample of the population. This evidence revealed disparate “no answer” rates for certain segments of the population and suggested that a universal citizenship question was “likely [to] cause a disproportionate number of noncitizens and Hispanics to go uncounted.” The majority’s deferential approach glossed over these omissions.

If the Court had resolved the case on this first issue alone, the decision might have signaled a shift toward greater accommodation of political discretion in agency decisions. However, procedural irregularities provided a rare occasion for the Court to consider the Secretary’s subjective motivations. The five-to-four split on this second issue muddied the waters regarding the proper role of political motivation. Chief Justice Roberts’s majority opinion focused on the “significant mismatch between the decision the Secretary made and the rationale he provided.” The Chief Justice emphasized that this case turned on “unusual circumstances,” and noted that a “court may not set aside an agency’s policymaking decision solely because it might have been . . . prompted by an Administration’s priorities.” Based on that fact, the dissent expressed the hope that Chief Justice Roberts’s decision would prove “a ticket good for this day and this train only,” but the dissent also argued that the majority’s approach would encourage future litigants to challenge administrative decisions that reflected political pressure from the White House. Thus, the Court’s five-to-four ruling on pretext fails to clarify the appropriate role of political influence.

In a case limited to a traditional administrative record, the Justices’ deferential approach to arbitrary and capricious review under Baltimore Gas would likely govern. None of the opinions expressly mentioned the late-breaking evidence documenting Dr. Hofeller’s clandestine role in orchestrating a racially-motivated citizenship question. This new evidence not only involved unlawful discrimination, but also raised significant questions about the deference owed to Secretary Ross’s evaluation of record evidence. In particular, Dr. Hofeller’s 2015 study suggests that the Secretary may have already credited secret evidence that a citizenship question would

depress responses by Hispanics. The majority’s finding of pretext implicitly addressed this concern in the immediate case, and happenstance is unlikely to again expose similar influences operating behind the scenes of agency decisions.

Still, the Court missed a legitimate and important opportunity to limit agency use of undisclosed evidence in future cases. By applying a deferential standard under *Baltimore Gas*, the majority glossed over the fact that the Secretary chose to base his decision on limited empirical evidence, and resulting uncertainty, when he bypassed the testing routinely employed for new census questions. Hofeller’s study suggests a sinister explanation for the Secretary’s choice. That is, it is possible that Hofeller’s study had already convinced the Secretary of the desirability of the citizenship question based on its predicted effects on “Non-Hispanic Whites” and that the Secretary evaded routine testing to suppress additional public evidence on this point. While it is not realistic to expect administrators to confess their true motives for regulatory action, especially the kind of motives that seem to be involved here, a decision to exclude readily obtainable evidence from an administrative record should be highly suspect. Here, a decision that the Secretary acted arbitrarily and capriciously by evading standard testing procedures would eliminate the need to consider subjective motivation. At the same time, it would prevent an administrator from basing his decision on secret evidence when relevant public evidence could readily be had. Justice Breyer’s call for greater scrutiny under the majority approach in *State Farm* would promote policy decisions based on public consideration of reasonably available evidence and check private agendas supported by hidden studies.

V. EXPERT ANALYSIS ADVANCES THE GOALS OF TRANSPARENT, DYNAMIC, AND EVIDENCE-BASED DECISION MAKING

While the Justices have expressed divergent views on the proper role of agency expertise, the academic community has also failed to develop a modern framework that acknowledges the value of agencies’ expert analysis in the face of policy change. Three leading approaches to agency change focus on political control, deliberative democracy, and the rule of law. The political control approach reflects a recently dominant general theory of administrative law, favors Justice Rehnquist’s dissent in *State Farm*, and would allow agencies greater latitude to substitute political concerns for expert analysis. The deliberative democracy and rule of law approaches

501 In the study, Hofeller analyzed data from surveys of a small portion of the population and concluded that addition of a citizenship question would be “advantageous to Republicans and Non-Hispanic Whites in redistricting.” See Letter to Clerk of the Court, *supra* note 132, at 4.

502 Shapiro, *supra* note 16, at 1097, 1099 (noting the “impoverished understanding of expertise” in rulemaking and describing “craft expertise” which operates alongside traditional scientific or economic analysis).
favor the majority holding in *State Farm* and retain more demanding requirements of expert analysis. As explained below, expert analysis affords more transparency than the political control approach and also supports and enhances the deliberative democracy and rule of law approaches.

A. The Political Control Model Undermines Transparent and Evidence-Based Decision Making Informed by Expertise

In *Presidential Administration*, Elena Kagan argued that Presidents should have increased authority to influence the policies of administrative agencies. To that end, Kagan rejected the doctrine’s “ideal vision of the administrative sphere as driven by experts” and called for relaxation of the *State Farm* doctrine. Kagan does not reject expertise entirely, but she would place the ultimate responsibility for expert decision making in the President, while relying on the President’s sense of self-restraint as the principal means for avoiding unwise intrusions in highly technical areas such as environmental protection. In place of a system based on technical expertise, Kagan urges a “revised doctrine” that would apply arbitrary and capricious review in a way that “centers on the political leadership and accountability provided by the President.” Kagan’s position aligns most closely with Justice Rehnquist’s partial dissent in *State Farm*, that is, she agrees that a “recession emanating from regulatory views held by the President” need not be “justif[ied]... in neutral, expertise-laden terms to the fullest extent possible.”

Kathryn Watts has echoed Kagan’s approach in an article that advocates greater deference to political considerations in arbitrary and capricious review. According to Watts, *State Farm’s* hard look review “currently hinges on an outmoded model of ‘expert’ decisionmaking.” She notes that a change “enabling courts to credit openly political judgments would help to bring hard look review... into harmony with other major administrative law doctrines that embrace the more current ‘political control’ model.” But neither Watts nor Kagan concurs fully in Justice Rehnquist’s partial dissent in *State Farm*. Instead, both argue that the Reagan Administration did not...
sufficiently explain the political reasons for rescinding automatic detachable
seatbelt requirements. According to Kagan, NHTSA’s decision lacked
“candid and public acknowledgement of the presidential role in shaping an
administrative decision.” Watts likewise faults NHTSA for failing to
openly discuss political factors such as “its reliance on the Administration’s
overall priorities.” Had NHTSA emphasized these political concerns,
Watts continues, its “explanation should have been enough (combined with
its focus on facts and logic) to constitute a reasonable and adequate
explanation for the rescission” of the previous administration’s
requirements.

The problem with this approach, however, is that political actors often
prefer opaque explanations, or, in the words of Alexander Hamilton,
“secrecy.” Nina Mendelson has addressed the transparency problems
created by “silence” about the “content of White House influence” on
agency rules, explaining that “Presidents (and OIRA) have often chosen
to lie low with respect to particular agency decisions.” For that reason,
Mendelson has argued, arbitrary and capricious review cannot bring about
adequate disclosures, and congressionally mandated disclosure rules are
therefore necessary to prompt transparency.

Likewise, OIRA review of proposed rules tends to be opaque, creating
“unrestricted and nontransparent opportunities for political oversight and
editing of agency technical analyses.” Even when political actors give
reasons for their actions, they may not be candid, and an administration that
wishes to conceal the influence of a special interest group, for example,
would likely “couch its decision as being based on opposition to intrusive
and needless government regulation.” The fortuitous discovery of
clandestine political motives in the census case further illustrates the
inherent problems with a framework that expects agencies to divulge
political reasons for their decisions. This tendency to conceal political

motives prevents voters from holding the President accountable for agency policy choices, even though accountability is a fundamental justification that scholars like Elena Kagan advance for favoring presidential control to begin with.

Expert analysis has far more potential to enhance transparency within a politically motivated framework. Transparent analyses of scientific, technological, or economic evidence can legitimize agency decisions by demonstrating consistency with both congressional mandates and generally accepted scientific norms. Such analyses serve to show whether an agency has complied with its statutory mandate or succumbed to political pressure to ignore relevant facts or disregard the public interest. Moreover, as Sidney Shapiro, Elizabeth Fisher, and Wendy Wagner have recently explained, independent expert analysis can “speak[ ] truth to power” by pointing out how political goals may be “inconsistent with scientific and policy evidence.” Even when expert agency conclusions ultimately yield to political concerns (such as the potential cost of regulation), expert analysis will add transparency to the process and illuminate the political tradeoffs that are being made. In some cases, expert analysis may also constrain agency discretion and limit politically driven results at the agency level. William Buzbee notes that even under the Trump Administration, for example, the Federal Energy Regulatory Commission “unanimously declined a request by the Department of Energy to change policies to support the coal industry, finding it legally and factually without merit.”

Expert analysis of relevant evidence may also support a middle ground between the polarized positions staked out by pro- and anti-regulatory zealots. Finally, expert analysis can facilitate judicial review to check overly politicized agency decisions that fail to supply adequate expert analysis. As previously noted, courts have repeatedly struck down regulatory rollbacks when Trump

526 Buzbee, supra note 10, at 1423 (citing Order Terminating Rulemaking Proceeding, Initiating New Proceeding, and Establishing Additional Procedures, 162 FERC Par. 61,012 (Jan. 8, 2018)); Freeman & Vermeule, supra note 453, at 99–100 (noting that the EPA would be hard-pressed to cite significant uncertainties regarding the relationship between greenhouse gases and global warming).
527 Doremus, supra note 16, at 415 (The “precautionary principle” and “sound science” approaches, which offer “competing theories” for and against regulation, may be “driven more by ideology than by data or careful reflection”).
Administration officials had failed to discuss inconvenient facts or show that their conclusions were supported by expert analysis.  

Arbitrary and capricious review also has the potential to bolster both the transparency and the quality of expert agency analysis. Under the deliberative process privilege, for example, agencies may withhold internal scientific recommendations provided to political agency heads. If an agency fails to communicate its ultimate conclusions on these recommendations, however, it may flunk arbitrary and capricious review because it will have failed to consider an important aspect of the problem. Further, the arbitrary and capricious review provisions of APA section 706 may bolster notice-and-comment rulemaking procedures by requiring agencies to provide the courts with the “whole record” of scientific studies or other materials that were considered by the agency.

A final problem is that agencies tend to disclose expert analysis to a fault: they are so much more comfortable disclosing expert analysis that they may sometimes generate such analyses to mask unseemly political influences. Arbitrary and capricious review places some limits on an agency’s ability to manufacture a scientific charade, however, because an agency ultimately cannot offer “an explanation for its decision that runs counter to the evidence before” it. All in all, a system premised on expert analysis promotes transparency and the consideration of scientific, technological, or economic evidence mandated by Congress far better than one premised on politics. And without sufficient transparency, it is doubtful that the political control model can achieve its ultimate goal of holding the President electorally accountable for an agency’s policy choices.

Of course, electoral accountability is itself imperfect. See Staszewski, supra note 10, at 868 (noting that election results will not influence all executive decisions or those made during a President’s second term).

An important response to the political control approach questions the legitimacy of agency decisions that are based primarily on the President’s political goals. Glen Staszewski’s 2012 article argues that the political control model is inferior to an approach based on deliberative democracy. Deliberative democracy “focuses on the obligation of public officials to engage in reasoned deliberation on which courses of action will promote the public good.”

It checks the “tyranny of the majority,” encourages agencies to include minority interests in the weighing of competing viewpoints, and promotes the goal of “reach[ing] the best decisions on the merits in light of the available information.” Only grounds that “could reasonably be accepted by free and equal citizens with fundamentally competing perspectives” will satisfy the “reasoned explanation” requirement.

Basic tenets of deliberative democracy align with State Farm’s requirement of expert analysis. State Farm requires agencies to consider all “important aspect[s]” of a problem, explain decisions in a manner consistent with the “evidence before the agency,” and reach a conclusion that can plausibly “be ascribed to a difference in view or the product of agency expertise.”

Notions of deliberative democracy also align with Justice Kennedy’s concurrence in Fox, which called for agency decisions that are explained “in light of the data available,” are “informed by the experience and expertise of the agency,” and “can be justified by neutral principles and a reasoned explanation.”

The approach taken in Justice Rehnquist’s partial dissent in State Farm, on the other hand, eviscerates these deliberative standards and gives expert analysis second seat to executive preferences.

Mark Seidenfeld’s related critique develops a helpful synthesis that captures the relationship between political influence and State Farm’s apolitical, reasoned decision making requirement. Seidenfeld distinguishes motivations from justifications and notes that judicial review focuses solely on the latter. As a result, “hard-look review does not second guess legitimate policy decisions by agencies that are motivated by raw politics.” Instead, it simply “prohibit[s] decisions that cannot be justified by anything other

517 Seidenfeld, supra note 10, at 151.
This distinction and accommodation of political influence is crucial. It provides for reasoned decision making within a framework that addresses a central, political control critique of agency decision making, namely, that agencies lack the President’s political energy to bring about policy change. Seidenfeld’s explanation accommodates change initiated at the President’s bidding, so long as the agency’s ultimate policy decision can be justified by more than raw politics and incorporates the kind of reasoned analysis of relevant evidence contemplated by *State Farm*.

Further, as Seidenfeld notes, attempts to legitimize the substitution of political motivations for reasoned justifications will undermine transparency and relieve “the agency of its obligation to reveal the full implications of its rulemaking.” Thus, in addition to checking raw political decisions that cannot be justified by record evidence, expert analysis promotes transparent decision making. This sort of transparency may enhance political accountability and better inform voters. In addition, disclosure of expert analysis may inform scientific or expert communities about important areas of regulatory inquiry and therefore facilitate advances in scientific or other fields of knowledge.

What deliberative democracy may not explain, however, are cases in which agencies appropriately engage in dynamic decision making outside of a more formal and public deliberative process. The Federal Reserve Open Market Committee’s “exceptionally rapid and proactive” expert policy response to the 2007–08 financial crisis is but one example of the many significant but informal actions that agencies can implement without notice-and-comment rulemaking or more formal procedures. Indeed, the APA even specifies certain circumstances in which agencies may make *binding rules* without the deliberation required by notice-and-comment procedures. For example, under section 553(b), an agency may publish a binding policy decision without notice-and-comment procedures if it has and cites record evidence of “good cause” for immediate action. This exception calls

546 See discussion supra notes 346–48.
547 See 5 U.S.C. § 553(b)(3)(B) (noting that an agency may bypass notice and comment if it “for good cause finds . . . that notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest”).
for streamlined expert judgments—consideration of record facts and a rough cost-benefit analysis of whether immediate public safety or other emergency circumstances outweigh the need for more thorough deliberation.548

The good cause exception allows agencies to impose rules summarily, but it cannot be used to circumvent expert analysis in favor of raw politics. The Trump Administration’s attempts to stretch the good cause exception to accommodate immediate political change and “regulated industry” interests have been rejected as “inconsistent with legal precedent on the nature of ‘good cause.’”549 Even though exigent circumstances preclude more lengthy deliberation, expert decision making and the consideration of record evidence are still needed to provide a check on arbitrary regulatory change. Expertise adds legitimacy to decisions made without lengthy deliberation, and it aligns with deliberative democracy by providing a reasonable ground for decision that could be acceptable to citizens with competing perspectives.

C. Expert Analysis Advances the Rule of Law by Stabilizing Policy and Curtailing Administrative Policy Change Based on Whim

Some of the most recent criticisms of administrative agencies, such as those voiced by Justice Gorsuch, have called for greater limits on the ability of agencies to change policies based on “bureaucratic whim.”550 This critique reflects rule of law concerns, especially when agencies invoke Chevron deference to justify changed interpretations of regulatory statutes. Randy Kozel and Jeff Pojanowski’s analysis anticipates such objections. They offer a rule of law approach that would limit agency change and give courts greater ability to impose static interpretations of congressional intent.551 But their analysis does not impose similar rule of law constraints

548 See Heinzerling, supra note 63, at 34 (noting that courts often limit the good cause exception to “emergency situations”). This discussion also assumes that the deliberative democracy model allows rational limitations on analyses when the benefit of a present decision outweighs the costs of further deliberation. See also Gersen & Vermeule, supra note 485, at 1361 (“[T]here is nothing in State Farm itself that is incompatible with our approach.”). Cases such as Business Roundtable v. SEC, 647 F.3d 1144 (D.C. Cir. 2011), in which the D.C. Circuit arguably expanded agencies’ reasoned decision making obligation, are beyond the scope of this Article.

549 See Nat. Res. Def. Counc. v. Nat’l Highway Traffic Safety Admin., 894 F.3d 95, 115 (2d Cir. 2018) (rejecting argument that NHTSA had “good cause” to circumvent notice and comment procedure when it indefinitely delayed increase in civil penalties). See also id. (“That a regulated entity might prefer” regulations that are “less costly to comply with does not justify dispensing with notice and comment.” (internal citation omitted)); Heinzerling, supra note 63, at 34–42 (discussing Trump Administration’s meritless attempts to invoke the good cause exception based on “nonsensical” arguments).

550 See Buzbee supra note 10, at 1368–69 (discussing Gorsuch’s “regulatory whim” theory).

551 See Kozel & Pojanowski, supra note 9, at 163 (“The decision to reject an expository rationale it previously adopted should subject the agency to de novo review. Assuming that the agency has offered an explanation of why the previous understanding of its discretion was incorrect, the court’s task would be clear: It would evaluate the new explanation de novo.”).
on policy decisions that are left open by statute and involve "prescriptive" reasoning based on economic or other expert analysis. As William Buzbee recently pointed out, however, it is "exceedingly rare" that statutory language requires one particular policy action. Buzbee argues that judicial consistency doctrines have also checked bureaucratic whim in policy decisions that Congress has delegated to agencies. He describes State Farm's majority opinion as the "foundational modern case" that establishes a "consistency doctrine." Proposals to move away from the State Farm majority and facilitate impulsive political change do not adequately account for "the Supreme Court's persistent doctrinal emphasis" on the need for agency analysis of "underlying facts, science, circumstances, the record, and the agency's past reasoning" before changing policies. The Court's reasoned decision making requirements have a stabilizing effect on policy and provide "a brake on erratic or unexplained sudden change."

Expert analysis of relevant evidence supports these rule of law values. Although underlying technical or scientific evidence will change, the time it takes to engage in expert analysis tends to promote reasoned analysis, stabilize policy, and limit sudden or adventitious change. Critically, this consistency doctrine does not operate like stare decisis, impose a substantive preference in favor of earlier policy decisions, or restrict agencies to traditional judicial methods of decision making. Buzbee notes, for example, that the Trump Administration "probably" has the power to "substantially revise the many rules" it began to reconsider in 2017–18. The primary impediments to change are analytical steps that foreclose impulsive policy swings: Presidents cannot direct agencies to "short-circuit the regulatory process" and shirk reasoned decision making "that frankly addresses both supportive and contrary evidence."

These analytical requirements may create obstacles for the Trump Administration. The EPA’s initial efforts to undo the Waters of the United States Rule and the Clean Power Plan, for example, did not call for more

552 Id. at 160 (siding with Rehnquist’s partial dissent in State Farm and noting that "the agency was within its rights to reverse itself" on detachable seatbelts).
553 Buzbee, supra note 10, at 1363. 554 Id. at 1396.
555 Id. at 1401. 556 Id. at 1403. See also id. at 1407 (noting that agencies have strong incentives to comply with these requirements initially so that they are not later reversed on appeal).
557 The OMB’s emphasis on peer review also supports these rule of law values. See Memorandum from John B. Bolton, Dir., Office of the President, to Heads of Dep’ts & Agencies (Dec. 16, 2004), available at https://www.cio.noaa.gov/services_programs/pdfs/OMB_Peer_Review_Bulletin_m05-03.pdf (issuing government-wide guidance aimed at enhancing the practice of peer review of government science documents).
558 Buzbee, supra note 10, at 1425.
559 Id. at 1426.
thorough analysis of these major policy changes. The EPA expanded its analysis only after courts rejected many of the Administration’s early attempts to impose immediate change by fiat. As a result, the EPA did not begin more earnest analytical efforts until over a year into Trump’s first term and amidst churning leadership at both the Agency and the Executive Office of the President. If the Trump Administration ultimately fails to support its rollbacks with expert analysis of relevant evidence, its policies are unlikely to survive judicial review. And even if inadequately supported policies somehow survived judicial review, they would be especially vulnerable to revision by future administrations. Future administrations would generally be required to analyze contrary evidence supporting decisions made by past administrations, but that would present no obstacle here, as no such evidence would exist.

CONCLUSION

The Trump Administration has failed to recognize the importance of expert analysis in politically directed policy change. Its position aligns with Justice Rehnquist’s partial dissent in State Farm, as well as with two recently popular views in administrative law scholarship: the desirability of presidential control of administration and the tendency to view expertise as an anachronistic relic of the New Deal. The latter view has posed an especially formidable obstacle to recognizing the continued importance of expertise in government regulation. Even scholars who have opposed strong claims for executive power, and have supported the need for reasoned decision making, have nevertheless under-theorized the role of expert analysis within a regulatory framework that acknowledges the need for political input.

To address that shortcoming, this Article identifies a critical role for expert analysis within a dynamic and politically guided framework. Change is not the exclusive province of the executive; it is also a central aspect of much of the expert decision making that Congress has delegated to agencies. Within our system, agencies possess unique advantages in accommodating changing bodies of scientific, technological, and economic data in the formulation of regulatory policy.

560 Id. at 1388 (noting that an “initial wave of actions engaged minimally with previous agency reasoning” and did not provide “greater justifications” until summer of 2018 and leadership of a new administrator).

561 See id. (“The Clean Water Rule, the CPP rollback, the replacement proposals, and the final water ‘applicability date’ rule as described here are only the beginning of lengthy legal battles. Nonetheless, they reveal broad change power claims.”).

562 Id. at 1419 (noting that agencies seeking to change policies generally have a greater burden because they must “address the old justifications” in addition to any new evidence supporting the changed policy).

563 See supra note 82 (discussing proposed rules that cite Rehnquist’s dissent in State Farm).
State Farm’s requirement of reasoned, expert analysis also has a distinct capacity for promoting transparent decision making. Transparency in the regulatory context benefits the public and the academic and scientific communities as well as those directly affected by regulation. Further, if agencies must justify policies through reasoned, expert analysis of relevant scientific, technological, or economic evidence, they may also have an incentive to adopt policies that make sense to groups beyond the President’s base of support, thereby strengthening public confidence in government. Decisions based on reasoned, public analysis of relevant evidence may afford greater legitimacy than policies that are adopted without explanation and seem to reflect nothing more than the current preferences of an administration’s political appointees. Expert analysis may also add legitimacy to expedited agency decisions that are appropriately conducted outside of a public notice-and-comment rulemaking process.

Lower courts have unquestioningly applied State Farm’s reasoned decision making test to check the Trump Administration’s impulsive and insufficiently reasoned policy changes. Indeed, in some cases, early losses in court have appeared to motivate the current administration to supplement proposed rulemaking dockets with expert analysis that it originally refused to provide. These initial judicial decisions also reinforce the value of reasoned, expert analysis on fundamental questions of national policy made within a politically directed framework. Presidential administrations may come and go, but their regulatory legacies will ultimately depend on their ability to support administrative change with reasoned analysis of relevant scientific, technological, or economic evidence.

It is too early, at the time of this writing, to say whether the Supreme Court will be able to resolve its own internal conflicts concerning the proper role of expertise in policy change. But the Court may have become less inclined to defer to executive discretion and control (as shown in the mounting criticism of Chevron) and more concerned with the need to check administrative decisions that appear to be based on personal “whim” or hidden animus. Even early proponents of presidential control, such as now-Justice Kagan, may not have envisioned what may ensue when a President lacks respect for the legal and expert limits within which agencies have been thought to operate. The Court’s limited and divided rulings in
